Antipyrine and Acetanilide, especially the latter, are growing in favor as reliable remedies for controlling many of the abnormal nervous manifestations of pregnancy. They control reflex irritability in a remarkable manner, and in the cephalalgia of the first stage, where there is a convulsive action, Dr. Jones had been delighted several times with the action of acetanilide. He gives this agent in many cases in which he formerly gave an opiate, and likes its action much better.

Dr. Frank S. Johnson, of Chicago, one of the special committee to report on the present status of bacteriology in its relation to disease selected for his theme

The Bacillus in Syphilis.

Few questions he said in medicine have received more attention than that of the nature of the poison of syphilis. Early in this century the most able investigators had given it careful study, but not until within the last few years has there appeared to be any real advance in the knowledge of the subject. In 1884 and 1885 Lustgarten found a bacillus which he describes as follows: "In size and shape it very closely resembles the tubercle bacillus of Koch, and lepra bacillus of Hansen. It is sometimes bent at an angle, or is spoon-curved. In color reaction, it is also similar to the tubercle bacillus. It does not occur, however, in the tissue spaces, but is found in cells; very few are found in the lesions. They are found in all the lesions of syphilis, primary, secondary, and tertiary, and are found in the syphilitic secretions." Matterstock found also that the condition best suited to the development of the smegma bacillus were (1) a mixture of the secretion with that of sebaceous glands and macerated epithelium; (2) equable temperature of about the body warmth, and (3) an acid reaction of the cultured medium.

Dr. Johnson's conclusions are:

1. A bacillus exists, recognizable by its form, size, and color. Reaction has been found by a number of observers in all syphilitic lesions, and in all stages of the disease, and has also been found in the blood of syphilitic patients. There is a widespread belief among investigators of this subject that this organism has an etiological relation to the disease.

2. This bacillus is not uniformly found in the secretions of ulcerating, syphilitic lesions.

3. A bacillus almost identical in form, size, and color reaction has been found in the secretions of the external genitalia of healthy persons.

4. The possible presence of this smegma bacillus in the secretion of doubtful sores renders microscopical examination of the secretions in these cases nearly valueless.

Dermatology and Venereal Diseases.

Dr. H. J. Reynolds, of Chicago, referred first to a case of

Tylosis of the Hands.

In an article on the uses of concentrated lactic acid by Dr. J. P. Knoche, (*Journal Cutaneous and Venereal Diseases*, April, 1887) he states that he found that much of the thickening could be removed by rubbing in the undiluted acid for a few minutes, and by gentle scraping. He again applied it seven hours afterwards and in twenty-four hours was able to remove the thickening completely, leaving the skin soft and smooth. He then treated the parts with oxide of zinc and tar ointment, but found in about a week the growth began to reappear. The acid was again applied and repeated, using the above ointment at intervals, and after a few months of this treatment the parts remained cured. Though the affection is comparatively an insignificant one, it is not only at times extremely annoying to the person so afflicted, but likewise extremely difficult to get rid of. He also found it (when applied two or three times daily) a most efficient treatment for warts. In freckles and chloasma he found the acid when diluted to one-third its strength and applied daily to be the most efficient means employed for that purpose. After its use for a few days, with a mild ointment during intervals, these discolored patches peel off, leaving a slightly reddish surface, which disappears in a few days, leaving a good clear skin. The use of the drug is associated with much less pain than the liquor potassæ, bichloride of mercury, and other preparations used for such purposes.

Urethritis.—He had nothing to offer in advance of the old and time-honored method of treating this affection. He is in the habit himself of using a saturated solution of boracic acid for an injection, rendering the urine at the same time less irritating by the use of an alkali, and occasionally resorting to the other well-known remedies, cubebs,

copaiba, etc. Boracic acid does not produce any unpleasant symptoms, such as prostatitis, cystitis, etc., which were in his opinion brought on by strong injections.

Chancroid.—In treating this affection he had ideas which might seem in the line of advancement. During a very extensive experience in venereal diseases, he had used almost nothing in the way of medicine but pure impalpable boracic acid in treating chancroid, ordering the patient to wash the parts with soap and water, three or four times a day before applying the powder. The ulcers treated in this way would heal remarkably well. He had never found it necessary to cauterize or burn chancroidal ulcers. This drug, although not so soothing as iodoform, is in his opinion far more preferable than the latter, which is so highly extolled in such affections, and the constant use of which had compelled a patient who came under his observation to change his boarding-house nine times in three days.

Dr. G. W. Jones, of Danville, in opening the discussion, said he emphatically endorsed Dr. Reynold's treatment of gonorrhœa and chancroid. He had found nothing so useful as impalpable boracic acid in the treatment of such affections, more particularly in women where the vaginal canal could be packed with it. It was really surprising to note the rapidity with which a large number of patients got well.

Dr. J. H. Miller, of Oconee, said that in addition to boracic acid in gonorrhœa, he combined with it the sulpho-carbolate of zinc with good effect.

Dr. F. C. Robinson, of Wyanette, asked what Dr. Reynolds used as constitutional treatment for chancroidal ulcers; whether or not he relied exclusively upon the application mentioned.

Dr. W. T. Thackeray, of Chicago, said that Dr. Lee, of St. Louis, applies little tablets or granules of boracic acid within the uterus and urethral canal with an instrument which he has devised for that purpose, and which he exhibited at the meeting of the American Medical Association in Cincinnati.

Dr. Miller, of Peoria, remarked that when the practice of treating chancroids with sulphuric acid and charcoal was in vogue, he observed frequently the irritating effect and phagedenic condition which the ulcers took on, but since adopting the boracic acid treatment, which he had used almost exclusively during the past three or four years, the ulcers or sores had done much better, had healed more kindly, and no destructive action had taken place in the cases which formerly gave him so much difficulty and annoyance.

Dr. Rooney, of Quincy, asked how many days it took to cure a case of gonorrhœa with boracic acid.

Dr. Jones, of Danville, said he had seen bad cases in women get well in a week—that is, the discharge would cease in about that time.

Dr. Reynolds, in closing the discussion, said with regard to Dr. Robinson's question, he would say that nearly every practitioner recognized the fact that most local conditions, no matter how remote, were almost invariably aggravated or prolonged by disorder of the constitution, consequently appropriate constitutional treatment should be instituted. As to the time required to cure a case of gonorrhœa, statistics showed that the disease proceeds to a cure under good, careful management, hygienic and otherwise, about as quickly without treatment of the disease as with it.

Ophthalmology and Otology.

Dr. S. S. Bishop, of Chicago, read a paper on

A New Otoscope

for the diagnosis and treatment of middle ear affections under passive motion, and exhibited the instrument.

The pneumatic otoscope which he had devised for the purpose named, consists of a small milled cylinder, with an ear funnel of the most serviceable pattern at one end, and an eye-piece containing a lens, around which revolves an adjustible mirror, at the other end. In the side of the cylinder a spacious aperture admits light to the illuminating surface beneath. At the funnel end of the instrument is a pneumatic chamber provided with a rubber bulb, with a flexible tube ending in a diminutive syringe, or a lip-piece, as one may prefer. The value of passive motion in the treatment of stiff joints and atrophied tissues is well recognized in general surgery. The application of the same principle to the same conditions in aural surgery is attended with equally beneficial results.

Third Day, Thursday, May 17.

Dr. D. W. Graham, of Chicago, read a paper on

Some Points in Hernia Clinically Considered,

in which he advocated the following points: 1. An umbilical or femoral hernia with pronounced symptoms of strangulation demands herniotomy without previous resort to taxis. 2. Irreducible omental hernia, with or without

symptoms of strangulation, demands operation for the patient's safety.

The following papers were also read: on

Chronic Rheumatic Sore Throat,

by Dr. E. F. Ingals, of Chicago; on

The External Application of Sulphur in Sciatic Neuralgia,

by J. W. Cowden, of Rock Island; on the

Possibilities of Volapük or Universal Language in Relation to Medical Science,

by David Prince, M.D., of Jacksonville; on

Digestive Ferments for Dissolving False (Diphtheritic) Membrane,

by Dr. A. J. Saunier.

Officers for Ensuing Year.

President, Dr. Charles Warrington Earle, of Chicago; *First Vice-President*, Dr. P. H. Oyler, of Mt. Pulaski; *Second Vice-President*, Dr. George L. Eyster, Rock Island; *Permanent Secretary*, Dr. D. W. Graham, of Chicago; *Assistant Secretary*, Dr. T. M. Cullimore, of Jacksonville; *Treasurer*, Dr. Thomas M. McIlvaine, of Peoria.

Place of next meeting, Jacksonville, Ill.

Periscope.

The Improved Cæsarean Section, with the Report of a Successful Case.

Dr. Garrigues, of New York, contributes an article on the Improved Cæsarean Section to the *Amer. Journ. of the Med. Sciences*, May, 1888, and reports a successful case. He alludes to his two previous papers on the same subject, and still maintains that no man's name should be associated with the operation, since it "is a beautiful outgrowth of general surgical and special gynecological development, an evolution due to the combined efforts of many men working independently of each other in different countries, especially Lister, in Scotland; Spencer Wells, in England; Guéniot, in France; P. Müller, in Switzerland; Leopold, in Germany, and last, but not least, Lungren, in the United States."

In the case reported, the indication for section was general contraction of the pelvis. The true conjugate was estimated at 8 cm. (3.1 in.). Operation was decided on before labor began, and Cæsarean section selected in preference to laparo-elytrotomy or the Porro operations. The operation was begun after 12 hours of labor, and lasted 78 minutes. Sublimate solution (1–5000) was used for sponges, carbolic (1–40) for instruments. Mother and child saved. The puerperium was practically normal.

Garrigues still thinks it best to eventrate the uterus before incising it (Müller); also, to use the elastic ligature (Esmarch), which should not be tied nor clamped, but tightened and held by an assistant. He follows Frank in inserting stitches through the upper end of the abdominal incision, which are to be tied before incising the uterus, thus preventing prolapse of the uterus. Delivery by the head is preferred, since when the feet are extracted first the contracting uterus is apt to grasp the child's neck, and render delivery slow and difficult. The lower uterine segment should be avoided in making the incision, but the line of demarcation is not always plain. For suturing the uterus curved needles are preferred; for the abdominal wall, Well's long, straight, triangular needles. For suturing the uterus, interrupted sutures should be used, inserted in such a way as to bring not only the edges of the incision together, but the peritoneal surfaces also. The endometrium must be avoided. A row of superficial stitches should be inserted in a manner similar to the Lembert intestinal suture. Garrigues thinks that aseptic silk is the best suture material. Catgut is unreliable, and silver wire is more difficult to handle than silk. He does not agree with Kehrer that it is advisable to aim at coalescence between the uterus and the abdominal wall; but he follows Kehrer in inserting deep uterine sutures before removing the placenta, in order to waste no time, and yet allow some minutes for the natural separation of the placenta. No drainage is required in a clean operation. Where putrid liquor amnii or meconium enters the peritoneal cavity it should be washed out with plain water or some disinfectant fluid. Garrigues would never employ drainage primarily. Should indications arise subsequent to the operation, the abdominal wound could be re-opened and drainage or irrigation instituted. He advises against leaving a drainage-tube in the uterus, also against Leopold's practice of injecting ergotine into the uterine parenchyma, and against removal of the ovaries to prevent subsequent pregnancies—the operation is sufficiently serious without introducing unnecessary factors. In the case reported, the omentum was simply pushed above the fundus of the uterus.

Garrigues considers Cæsarean section safer for the mother than difficult extraction through the natural passages. In his experience, these difficult extractions have been in pelves with moderate general contraction, and of the male type. In this country greatly flattened pelves are rare. He is not prepared to decide as to the relative

positions of craniotomy and Cæsarean section. He alludes to the difference in mortality in hospital and private cases in America (5 out of 6 saved in hospitals, 1 out of 5 in private) under the improved operation, and considers that the cause of the bad results in private practice is the defective use of antiseptics. Delay in operating is also an important cause. Whenever possible, operation should be decided on before labor sets in, and attempts to deliver by the natural passages should not be made in cases requiring Cæsarean section. The article concludes with a review of the technique of the operation.

Treatment of Asthma.

In concluding a long article upon asthma in the *Deutsche Medizinal-Zeitung*, April 16, 1888, Dr. Brügelmann divides the disease into the following five groups, according to its causes: Nasal asthma, toxic asthma, pharyngo-laryngeal asthma, bronchial asthma, and neurasthenic asthma. He thinks that only the first and third groups belong exclusively to specialists in diseases of the nose and throat, and these only when the body is not very much reduced. The second group requires the coöperation of specialists. He approves the dictum of Boecker, that "In the treatment of asthma, the treatment of the whole constitution of the patient is of the greatest importance." With regard to the value of certain drugs in the treatment of this disease, he says that iodide of potash is of assistance in bronchial asthma, and perhaps is of temporary service in the toxic form; while arsenic is of no benefit except in neurasthenic asthma. Cannabis indica, he says, is very uncertain. Pyridin, highly recommended by Lublinski, proved of temporary benefit in a few cases of bronchial asthma, but in all other cases, especially when severe, it failed. Amylene hydrate, recommended by Pick, did good service both in nasal and pharyngeal, and also in bronchial asthma, although very transiently. Cocaine internally, and by injections, recommended by Beschorner, is at times of surprising benefit in neurasthenic asthma, but frequently fails in the other forms, and often brings about alarming symptoms. Morphia is in all forms of asthma indispensable as a last resort. Chloral gives rest in all cases, and is likewise indispensable. As to electricity, he says that the induced current acts very strikingly in bronchial asthma, and sometimes also in toxic asthma, but in the other forms it is inactive. He has seen no results from the constant current. The smoke of some burning stramonium with sal ammoniac is one of the oldest agents, and is of great value as a palliative. It produces irritative coughing at first, but then brings quiet, especially in toxic and bronchial asthma, and to a less degree in neurasthenic asthma. In the other two forms it is inactive.

Cachexia in Graves' Disease.

In a note to the Society of Medical Sciences, M. G. Gauthier suggested the original idea that the cachexia of the advanced stage of Basedow's disease is due, at least in a large number of cases, to lesions of the thyroid gland. In time this gland becomes altered and indurated. In some autopsies in which the examination has been made with care (in about a dozen of the published case) the lesions consist of a cirrhosis, which had caused the disappearance of the glandular element; of blood cysts, infarcts, etc., and in a word, of a functional atrophy of the gland. Gauthier then refers to the fact that myxœdema is found to occur as the result of ablation of the thyroid gland in cretins, and endeavors to show that there is the closest analogy between the cachexia of myxœdema and that of Graves' disease. He thinks that lesions of the thyroid gland operate to produce what he calls thyroid cachexia, just as lesions of the lymph-producing organs produce leucæmic cachexia, and lesions of the supra-renal capsules, the cachexia of Addison's disease.

He refers to a case in which puncture of a blood cyst of the thyroid caused the symptoms of the disease to disappear, and in which a return of the cyst brought about again recurrence of the symptoms of the disease.—*Bulletin Médical*, April 15, 1888.

Strophanthus in Typhoid Fever.

While many authors advise against the employment of strophanthus in typhoid fever from fear of intestinal hemorrhage, Poulet has obtained brilliant results from its use. In the *Bulletin gén. de Thérap.*, he publishes three cases of typhoid fever in which strophanthus was of excellent service. Employed in the initial stage of the disease, one or two grains in pill form are markedly antipyretic, and what is especially noteworthy, the action was continuous or absolutely final. The temperature sank at once about two or three degrees, but never fell below normal. Contrary to the existing supposition, strophanthus protects from hemorrhage, and occasionally acts as a purgative. It exercises no especial influence upon the frequency of the pulse in typhoid.—*Wiener med. Presse*, April 22, 1888.

THE

Medical and Surgical Reporter.

A WEEKLY JOURNAL,

ISSUED EVERY SATURDAY.

CHARLES W. DULLES, M. D., Editor.

The Terms of Subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Quarterly Compendium of Med. Science, -	2.50
Reporter and Compendium, - - - -	6.00
Physician's Daily Pocket Record, - - -	1.25
Reporter and Pocket Record, - - -	6.00
Reporter, Compendium and Pocket Record,	7.00

All letters should be addressed, and all checks and postal orders drawn to order of

Drs. RANDOLPH & DULLES,

N. E. Cor. 13th and Walnut Streets.

P. O. Box, 843. Philadelphia, Pa.

THE PHYSIOLOGICAL ARGUMENT IN OBSTETRICS.

Perhaps no statement is more frequently used in the discussion of obstetrical subjects than the assumed axiom that labor is a natural or physiological process. Upon this ground one practitioner bases his opposition to the use of the forceps, another to the binder, a third to antiseptic midwifery, and so on. While all will admit that labor in prehistoric woman was physiological, it is by no means true of the woman of to-day. Our maternal ancestor of prehistoric times, with perfect physical development, the result of natural life, a creature of instinct, not being guided by laws, customs or religions, living largely in the open air, or in temporary dwellings, was a very different creature from her modern representative. She did not enter on life burdened by hereditary disease. Her nervo-muscular apparatus was not disproportionately developed by force of social customs. Her mind was not developed at the expense of her body, nor her generative apparatus stunted for the benefit of her brain. Inter-marriage of different races had caused no disproportion between the size of the fœtal head and of the pelvis, nor had acquired disease caused distortion of the pelvis. So, also, labor itself was a different process, inasmuch as it was spontaneous, and not managed. Of this we can judge by our knowledge of labor among primitive people. Among these races delivery takes place in the open air or in some temporary retreat, and the mother, like the lower animals, is immediately able to care for her offspring. It has been suggested that the application of the child to the breast, or the fondling of it upon the abdomen is of assistance in causing the uterus to contract and expel the placenta and membranes. As these women do not discontinue their usual habits, gravity prevents retention of the lochia, or of the placenta within the vagina.

Dr. A. F. A. King, in a recent interesting and instructive paper (*Amer. Journ. Obstet.*, April, 1888), points out many ways in which labor is no longer a natural process, especially among the upper classes. Women are far from physically perfect. Many are cursed with hereditary disease or disease tendency. Many in childhood, some as adults, have suffered from disease resulting in distortion of the pelvic bones. The customs of the times tend to stunt the reproductive apparatus, so that the woman may go to her marriage bed with an imperfectly developed uterus, and perhaps diseased ovaries. The nervous system also is developed at the expense of the muscular system. Perhaps she is a victim of fashion in dress. "In the supple abdominal wall, where Nature has wisely placed no ribs at all, custom has added ribs of brass, and woman grapples them to her spine with hooks of steel." Likewise custom prevents pregnancy and labor from being a natural process. The continuance of sexual relations after conception finds no parallel in the rest of the animal kingdom. During labor, digital examinations are made by the doctor, perhaps by the nurse. Eve was hardly thus treated. Owing to the physical degeneracy of woman, it is considered necessary for her to remain in bed one, two or more weeks after labor. Thus drainage of the lochia is interfered with, and the dangers of putrefaction of the

discharges, not only in the bed, but within the genital passage, are encountered. Owing to diminished muscular force, and increased susceptibility to pain, labor is not so apt to be completed by the natural forces as among more primitive races. The practice of making vaginal examinations, perhaps irrigations, during labor, tends to remove the natural secretions, to impede the progress of the labor by increasing friction between the fœtal and maternal parts, and possibly, to favor laceration of the pelvic floor. The fact that woman is not dumb is a large factor in rendering labor unnatural. Perhaps she has been told of, and has practiced, the various methods of preventing conception, or of inducing abortion. From these or other causes she may enter upon her pregnancy with diseased genitals. Her manner of living during pregnancy is usually the result of advice from her friends or physician. Likewise her conduct during labor and the puerperium is directed by the dictum of the schools and not by instinct.

Hence, we may conclude that labor is seldom more than a relatively normal process; either the woman is changed from her prototype, or else her environment is radically different. Opposition to artificial assistance in labor, based upon the physiological argument, is illogical. Because her primitive progenitor was able to bring forth her young, unaided, and in safety, is no reason why modern woman should not have a difficult or delayed labor, terminated with the forceps, to the advantage of herself and offspring; the fœtal head eased through the vulva where perineal rupture is imminent; the binder applied to supply the intra-abdominal pressure which would be given by the abdominal muscles were she able to be upon her feet; noxious germs kept from her tissues by the use of antiseptic agents upon her genitals by the attendants, and even by irrigation within the birth passages—germs which are no part of a natural labor, but which gain entrance to her largely by the very means which she has taken to ensure her safety; the placenta gently expressed when she is not able to expel it so well herself; anæsthetics administered to relieve exhausting pain; and careful attention by both physician and nurse that she also may be restored to her family in usefulness and health.

SYRINGOMYELIA.

Syringomyelia is the name given to an affection of the spinal cord in which the latter becomes infiltrated with embryonal connective tissue cells which go on developing and producing connective tissue until a glioma is the result; this glioma then takes on degeneration with the formation of a cavity in the centre of the infiltrated area. The affected portion of the cord is generally the central gray matter about the commissure, but the cavity often extends backward into the posterior gray horns or into the posterior columns, and sometimes advances into the anterior cornua. In fact, the extent to which this cavity with its lateral diverticula may take the place of the normal tissue of the cord, varies from a few fine fissures to a honeycombed condition extending longitudinally through a considerable portion of the cord; the favorite seat, however, is the lower cervical and upper dorsal portion of the cord. It is not empty, but is filled with a thin and serous, or bloody, or thick and gummy fluid, or even a hyaline mass. It should be stated in passing, that this disease is to be distinguished from hydromyelus, which consists in a simple dilatation of the central canal of the cord.

Although the pathological changes in the cord which are present in this disease have been known for many years, its present name was given it in 1838 by Ollivier, and the disease has been so little studied in this country that the first and only paper written on the subject is one by Dr. M. Allen Starr, of New York, to be found in the *American Journal of the Medical Sciences*, May, 1888. Doubtless the chief reason for the lack of clinical reports on syringomyelia in this country has been the extreme difficulty in recognizing the disease. As will be readily understood from what has been said as to the patological anatomy, the clinical symptoms must be complex; in fact, so

varied are the phenomena that until recent years, as Dr. Starr shows, the possibility of a clinical diagnosis was denied. Reasoning, however, from the known function of the portion of the cord most frequently affected, the lower cervical and upper thoracic, as we have already said, it becomes evident that the first manifestations of the disease must be looked for in the upper extremity, and that as the lesion is a slowly progressive one, so the trophic and vaso-motor and sensory effects will be chronic in their character. Dr. Starr, in the article referred to, reproduces brief accounts of several very interesting cases of syringomyelia, which have been reported by German observers, from which we gather that there are certain symptoms occurring in a certain combination, which may be regarded as characteristic of this disease. In the first place, there is progressive muscular atrophy, accompanied with paralysis, affecting some or all the muscles of one limb, and usually extending to the opposite limb, and to the body, and sometimes attended with a reaction of degeneration in the paretic muscles. In the second place are vaso-motor and trophic disturbances in the affected limb, which consist of cyanosis, coldness, bullous eruptions, ulceration, abscesses, and even atrophy and fragility of the bones, and a diminution in the excretion of sweat. Finally, the sensory disturbances consist in the loss of sensations of pain and temperature in the atrophied part, although the senses of touch and location may be preserved.

While some readers may at first be inclined to think that the publication of descriptions of such rare diseases is inadvisable, to the more thoughtful it will be evident that their rarity is such in appearance rather than in reality, since a wider diffusion of the diagnostic points of the disease will lead to the detection of many cases which now go unrecognized, or are only discovered at the autopsy. That it is possible to recognize the disease clinically, Dr. Starr proves by detailing a case which he has had under observation since 1885; and since the publication of Dr. Starr's paper, Prof. Kahler's report of a case to the Verein Deutsche Aerzte in Prag has been published in the *Deutsche med. Wochenschrift*, May 24, 1888, In this case the symptoms already detailed, lead the author to the diagnosis of syringomyelia. It is also worthy of note that at the same meeting Professor Chiari, in speaking of the pathological anatomy, insisted upon the same points which have already been mentioned as distinguishing this disease from hydromyelus, although in this Drs. Frederick Taylor and Whipham are not in accord with Dr. Starr and most German authorities. Precision and definiteness in the determination of the nature and location of disease are appreciated very highly by the patient himself, even though, as in the present disease, he must be told that very little can be done for him; so that no apology is necessary for bringing this affection to the notice of our readers.

CHRISTIAN SCIENCE.

It is pleasant to note that the effects of so-called Christian Science—that mixture of fanaticism and fraud which has recently attracted to it so many silly people—are drawing down upon its devotees the condemnation of thinking men in all walks of life. Opposition to this strange delusion is no longer confined to medical men, and those who cling to it cannot now protest that those who oppose them are moved only by a desire to keep to themselves a lucrative business. All over the country the newspapers are making public the disastrous results which have followed the practice of the tenets of Christian Science, and are suggesting that those who advocate them should be treated as common swindlers. This, we believe, is a reasonable suggestion. There are doubtless many who have come to believe the teachings of the leaders of this sect, who are simply ignorant and credulous; but there are no doubt many who maintain their teachings solely in the hope of gain. The former deserve some pity; the latter deserve the penitentiary. The danger of permitting both to go unrestrained is seen in a certain number of deaths immediately traceable to the neglect of taking medical advice, and might be discovered in innumerable

instances, if we could learn of all the delayed recoveries, prolonged sufferings, and shortened lives which have been determined by this neglect.

The need for some action may be gathered from the fact that there are a number of institutions in the United States devoted to the propagation of this error. It is said that there are two Christian Science "colleges" in New York, one in Brooklyn, one in Boston, one in Milwaukee, one in Colorado, and four in Chicago, and that all are doing a flourishing business.

If this be so, it is high time that they receive the attention of the authorities. The medical societies of these cities have, we believe a duty in this matter, and might with propriety inaugurate an investigation which would place the effects of the so-called Christian Science in such a light before the public that its pernicious influences could no longer be permitted to go on unchecked and unpunished. No fear of having their motives misconstrued ought to prevent medical men from enlightening the community in regard to this delusion, and they may well add this labor to the mass of work which they are constantly doing to save their fellow-men from the consequences of their own folly.

LEGAL REGULATION OF PHARMACY.

The Sacramento *Bee* has recently called attention to the fact that there is no law which properly regulates the practice of pharmacy in the State of California. There was a law passed some years ago, which applied only to pharmacists in San Francisco; but this law proved of no effect. Since then—as well as before—the inhabitants of the whole of this important section of the country have been at the mercy of such competence in dispensing drugs as has been secured by the ordinary working of the laws of trade and the sense of responsibility which is felt by those who practice pharmacy in California.

This being the case, the people of California are to be congratulated and the druggists are to be commended, in view of the fact that accidents due to mistakes in dispensing drugs are not so common as to attract public attention, or to lead to general reprobation of so lax a system. Nevertheless, there can be no question that such a system is a shame and a disgrace to any State in which it exists. Modern society does not, and should not, usually permit a dangerous calling to be exercised with no restraints, except such as are suggested by the good or bad sense, or the commercial integrity of those who follow it; and no State ought to allow men to handle and dispense medicines—many of which are active poisons—without a legal determination of their mental and moral fitness to do so.

A number of States in the Union have laws which carefully guard the lives of their inhabitants against the dangers inseparable from an unregulated practice of pharmacy; and we trust that those which are not so civilized will soon place themselves on a level with those which are. Certainly so progressive a State as California cannot long remain in a condition of semi-barbarism in this respect; and its intelligent physicians and pharmacists should make common cause to induce its Legislature to pass, as soon as possible, a law properly regulating the practice of pharmacy, and to lessen one risk of accidental killing which now hangs over them.

VERNONINE.

A communication made May 14, 1888, by MM. Edward Heckel and F. Schlagdenhauffer to the *Académie des Sciences* calls attention to the properties of a substance for which the name "vernonine" has been proposed. It is obtained from the *vernonia nigritiana*, a plant which grows abundantly on the west coast of Africa, and which is called by the natives "batjentjor." Vernonine is the active principle of the root, and its properties are similar to those of digitalin. Its poisonous properties are much less than those of digitalin, being, according to MM. Heckel and Schlagdenhauffer, only one-eightieth as great as those of digitalin.

The experiments thus far conducted do not indicate whether or not vernonine is a valuable remedy for disorder of the heart;

but its comparative freedom from toxic properties leads to the hope that it may prove to be a useful substitute for preparations of digitalis. There have been so many substances which, within the last ten years, have been put forward as substitutes for digitalis, only to disappoint the hopes they excited, that it would not be wise to expect too much of this new one; but practicing physicians will watch with interest the developments of the physiological experiments going on in France, and be ready to welcome any evidence that it is more than a pharmaceutical curiosity.

THE MEDICAL SOCIETY OF STRASBURG.

On April 25, the *Société de Médecine de Strasbourg* was dissolved by an order of the German government, as we stated in the REPORTER, May 26. The French medical journals complain that this action was prompted by the fact that among its members were certain Alsatians who still "remembered and hoped." It is clear that this remembering and hoping seems less compatible with pure pursuit of science to the German author than it does to the French, and at this distance it would not be proper to express indignation at what may be a very proper proceeding on the part of the present rulers of Alsace. This much may be said: If the members of the Société de Médecine of Strasbourg made their body a place for cultivating feelings of enmity to their rulers it is not surprising that it has been suppressed. If they did not, this suppression is to be regretted, not only on the ground of science, but also on the ground of humanity and fair dealing. In any case we hope that our colleagues in Strasburg will find some way to continue their valuable scientific labors, and to establish a claim to the consideration and kind treatment of the government under which they live.

INOCULATION OF CARCINOMA.

The believers in the inoculability of carcinoma have suffered a disappointment. It was announced that at the meeting this year of the German Surgical Congress, DR. WEHR, of Lemberg, would give a demonstration of carcinoma nodules produced by inoculation from dog to dog. But when the Congress met, on April 6, it was found that the demonstration showed that the inoculated nodules, after a gradual increase, had diminished in size, until at the end of from six to eight weeks they had entirely disappeared.

BOOK REVIEWS.

[Any book reviewed in these columns may be obtained upon receipt of price, from the office of the REPORTER.]

PRAKTISCHE ANLEITUNG ZUR BEHANDLUNG DURCH MASSAGE UND METHODISCHE MUSKELÜBUNG. VON DR. JOSEF SCHREIBER, Mitglied der K. K. Gesellschaft der Aerzte in Wien, etc. Dritte verbesserte und vermehrte Auflage. Mit 150 Holzschnitten. Wien und Leipzig: Urban und Schwarzenberg, 1888. Practical Guide to Treatment by Massage and Methodical Exercise. By Dr. Joseph Schreiber, etc.

The earlier editions of this work, both in the original and in the English and French translations, have received so many and favorable notices that we can do no more on the appearance of this third German edition than call attention to the value it has for every physician. From no other book or books can we obtain such a complete knowledge of massage and its allied modes of treatment; and the study of the subject as described by Dr. Schreiber cannot fail to remove from the practice the air of mystery which still clings to it.

CORRESPONDENCE.

Prescription of Commercial Formulæ.

EDITOR MED. AND SURG. REPORTER:

Sir:—I beg leave to express my dissent from the views expressed in your editorial in the REPORTER, April 14. I think that the vast majority of the medical and pharmaceutical professions will agree that the prescription of commercial formulæ is an injustice to the patient *and the pharmacist.* It is not right to oblige a druggist to send to distant cities to purchase at an exorbitant price preparations which he is quite as competent to prepare from quite as good, and probably better drugs, at a much smaller profit. Nor is it right to compel a patient to pay such outrageous prices as are now asked for the most simple preparations of the most common drugs, which same preparations would be made up by any druggist for one half, and in many cases one fourth the price of the patented prescription. Such a state of affairs is not creditable to the common sense of the physician; and so long as pharmacists every day see physicians so prescribing as to

take their honest profits from their pockets, to send to manufacturing pharmacists of distant cities, it is no wonder to me that they feel obliged to take to prescribing, to eke out a livelihood. I believe that the claims of great skill, intricate and costly machinery, etc., etc., put forth by these manufacturing chemists, are all bosh, and that any ordinarily skilful druggist can compound our preparations of better and purer drugs, more accurately and more satisfactorily, at an average reduction in price to the patient, of at least 50 per cent., while themselves retaining as large a profit as before. This I personally know to be true in case of many preparations now claiming the patronage of physicians. Trusting others will more ably ventilate this imposition upon the public, I am

Yours truly, G. M. Foskett, M.D.

North Dana, Mass.,
April 17, 1888.

Notes and Comments.

Remarkable Survival of a New-Born Child.

Dr. Paul F. Mundé reports the following case to the *New York Medical Journal*, April 14, 1888: A primipara, with her child, was brought into the Maternity, Würzburg, Bavaria, in 1869, under police escort, with the following statement: While workmen were opening a sewer-drain in the yard of the residence of a well-known American merchant, whose wife was under von Scanzoni's treatment, they heard the screams of a child apparently proceeding from within the drain. On rapidly opening it, they found a full-grown new-born infant struggling in the filth, which they speedily rescued. Investigation being immediately made, in the water-closet on the *second* floor was found the cook of the family, an unmarried woman, collapsed on the floor. On being revived, she acknowledged being the mother of the child, and said that she was suddenly seized with an uncontrollable desire to go to stool, and when on the seat felt something rush from her, and fainted.

The child bore signs of having passed rapidly down the drain-pipe (in those days modern water-closets were uncommon in Germany, and most residences had merely closets directly connected with the soil-pipe, but neither trapped nor supplied with a pan). It was badly scratched and bruised, but was otherwise well, and it thrived. It weighed about ten pounds.

The mother, having concealed her pregnancy, was accused of intentional infanticide, and, despite my testimony at the trial that in the agony of the moment she was probably unconscious of the escape of the child, and was not responsible for its birth in the closet, she was sentenced to four years' imprisonment.

The distance traversed by the child was certainly not less than thirty feet, and it is marvelous that the child was not killed by the fall or suffocated in the filth of the drain. While I have repeatedly seen living and healthy children brought into the Maternity who had been dropped on the hard pavement of the street while the mothers were on their way to the Maternity, I know of no instance in my experience where a child has survived such a fall as the one I describe.

Slander, or Privilege.

It is reported from Norristown, Pa., under date of May 31, that the suit of Dr. E. M. Furey against Dr. Charles Bradley, for damages for slander, has been heard before arbitrators. Dr. Furey was an applicant for admission to the Montgomery County Medical Society about a year ago, and Dr. Bradley stated to the Society that the applicant had been guilty of criminal malpractice. He made the assertion, believing it was a duty he owed to the Society. It was testified that Dr. Furey had performed the operation alleged, and there is now a possibility that he will become the defendant in a criminal suit. The arbitrators had not yet rendered their decision when the report given above was made.

This is the case to which attention was called in an Editorial in the Reporter, July 9, 1887, and it seems likely that it will turn out as we expected at that time.

Resorcin as an Antipyretic.

Dr. W. C. Chapman in a communication to the *Medical Herald*, May, 1888, states his opinion as to the antipyretic properties of resorcin in the following propositions: 1. Resorcin, in one or two scruple doses in adults, and five to ten grain doses in children, reduces the temperature two to three degrees in about one hour. 2. The physiological effects can be watched more plainly than those of other drugs of this class. 3. When the temperature is down it can be kept there by reduced doses given one or two hours apart. 4. Being a valuable antiseptic it would seem to be especially indicated in fevers of septic origin. 5. It will be especially valuable if it is proved clearly, as circumstances now tend to show, that it deranges the organs of digestion *less* than the other antipyretics.

Medical and Pharmaceutical Congress at Barcelona.

During the time of the Universal Exposition at Barcelona a medical and pharmaceutical congress will be held under the auspices of the Council General of the Exposition, which has issued an announcement stating the regulations and giving a programme of the meeting, which is to be held from September 9–15. The programme contains a list of subjects for discussion, which cover some of the most important and most profound questions of medicine and of humanity.

We invite the attention of our readers to this meeting, and to the fact that the only conditions of membership are to send on one's name and pay ten francs. To take part in the discussions, one must have an academic degree and be engaged in the practice of a profession, or in lieu of this must submit some written work to the scientific sub-commission.

Treatment of Fetid Diarrhœa.

The following methods of treating fetid diarrhœa are recommended in the *Bulletin Médical*, May 9, 1888, and may be recommended now, when such troubles are likely to occur frequently:

℞ Salicylate of bismuth,
Calcined magnesia,
Chalk,
Phosphate of lime, of each 2½ drachms.
Rub to a smooth powder.
Sig.—A half teaspoonful twice a day.

With this give an enema composed of:

Salicylate of bismuth.....2½ drachms
Salicylic acid.....15 grains
Boiled water..... 5 fluid ounces

At the same time a strengthening diet must be used.

Another method is to use the following prescription:

℞ Naphthaline (pure),
Sugar, of each a drachm and 15 grains,
Essence of bergamot, one or two drops.
Rub to a smooth powder and divide into twenty parts.
Sig.—Take one every hour.

With this the following may be used as an enema:

℞ Naphthol, 30 grains,
Alcohol, a fluid drachm and a half. After the naphthol is dissolved, add a pint of distilled or boiled water.

NEWS.

—Mr. R. Clement Lucas has been appointed Surgeon to Guy's Hospital, London, in the place of Mr. Thomas Bryant, who has been made Consulting Surgeon.

—Dr. Mazzarini, of Bologna, who was formerly assistant to Professor Loreta, has died of splenic fever.

—A school of instruction for nurses has just been opened in connection with St. Luke's Hospital, in Utica, N. Y.

—A Mrs. Johnson, says the *Indiana Med. Journal*, June, 1888, crazed by the so-called Christian science method of healing, committed suicide after killing her little boy.

—Dr. Frank O. Stockton, formerly Professor of Laryngology in the College of Physicians and Surgeons of Chicago, has begun practice in Atlanta, Georgia.

—Dr. A. H. P. Leuf has been elected Director of Physical Education in the University of Pennsylvania, in the place of Dr. J. William White who resigned some time ago.

—An International Congress of Anthropologists has been in session in New York during the past week. The Congress met at Columbia College. A number of interesting papers were read.

—Opium smoking seems to be one of the dissipations indulged in by a few Harvard students. One of these opium smokers was recently found dead after smoking a pipe, and is supposed to have died of opium narcosis.

—Three tramps broke into the residence of Dr. William L. Yost, near Mountainville, Pennsylvania, Wednesday night, May 30, and one of them, who gave the name of George Coffin, was shot in the breast, and it is thought fatally wounded.

—It is announced that the University of Pennsylvania will soon begin the construction of a Maternity Ward on the grounds of the University Hospital. The building is to consist of a central portion and two wings. Sufficient money is already on hand to complete the erection of one wing.

—The *Berliner klin. Wochenschrift*, May 14, 1888, says that the number of approved physicians in Prussia on April 1, 1876, was 7,956; on April 1, 1887, it had risen to 9,284, an increase of 1,328, or 16.7 per cent. During the same time the population has increased only 11.2 per cent. While in the year 1876 there was one physi- to 3,229 people, in 1887 there was one to 3,054. This increase is not, however, distributed equally throughout the districts of the kingdom; in fifteen districts there has actually been a diminution in the relative number of physicians to inhabitants.

HUMOR.

FARMER—"And what is your brother Frank doing now?" City Visitor—"He's paying a good deal of attention to his etching." Farmer—"Um! What is he taking for it?"

HEALING POWER.—Flossie (aged four)—"Bobby, why do they call ministers, doctors?" Bobby (a lad of considerable information)—"'Cos they make folks better."—*The Epoch.*

IT SOUNDED SERIOUS.—Husband—"I tell you, my dear, I don't have any kind of success in business. I'm afraid I have a Nemesis." Wife—"Well, why don't you see a doctor about it?"—*Tid-Bits.*

THE USUAL WAY.—"I hear that the purser is quite sick this morning." "Sorry to hear that. Followed the usual nautical course, I presume?" "What is that?" "Gone to the Doc. for repairs."—*Ocean.*

"NOW, DOCTOR," he said, as he joined the medical gentleman in the street, "in the case of a man who can't sleep at night what would you advise?"

"I would advise him to sleep in the daytime."—*Life.*

A SYMPATHETIC HEART.—Old Mrs. Bently—"I felt so sorry for a poor man te-day, Josiah. He told me he had been deef and dumb all his life, an' I give him a dime." Old Mr. Bently—"How could he be dumb an' tell ye that he was dumb?" Old Mrs. Bently—"Why, deary me, Josiah Bently, I never thought o'that."—*The Epoch.*

UNLUCKY "READING NOTICE."—"Excuse me, sir," said the business manager to the city editor, "but you promised to print that puff of Smither's dry-goods store just as I wrote it." "Well, didn't I?" "No, sir. It wasn't published at all." "Did you write on one side of the paper only?" "Certainly." "Then I guess I must have published the wrong side of the manuscript."—*Washington Critic.*

LORD ERSKINE was in the habit of making a very effective pause in all letters replying to solicitation for subscriptions. He wrote: "Sir,—I feel much honored by your application to me, and I beg to subscribe"—here the reader had to turn over the leaf—"myself your very obedient servant," etc. One of the best instances of this form of pause occurred in a letter received by a popular physician. This gentleman was pleased with a certain aerated water; and, by his recommendations, he managed to secure for it some celebrity. For this, he expected neither reward nor thanks. Imagine his surprise, therefore, when he received one day from the makers of the aerated water an effusive letter, stating that his kind recommendations had done so much good that they ventured to send a hundred —(here the page turned over). "This will never do," said the doctor. "It is very kind, but I will never think of accepting anything." Here he turned the page, and found the sentence ran—"of our circulars for distribution."—*Chamber's Journal.*

OBITUARY.

LUCIUS CASTLE BUTLER, M.D.

Dr. L. C. Butler died in Essex, Vt., May 25, 1888. He was born in Essex, Vt., March 17, 1820. He received his early education in the district and high-schools of his native town, and in Bradford Academy, Vt. He studied medicine in the office of Dr. George Howe, of Jericho, Vt., and Dr. Leonard Marsh, of Burlington. He attended lectures at Dartmouth and Woodstock Medical Colleges, from the latter of which he was graduated in 1842. From the former he received the honorary degrees of M.D. in 1875.

Dr. Butler began the practice of medicine in Clintonville, N. Y., immediately after his graduation, and resided there and in Essex and Bradford, Vt., until 1860, when he went to Philadelphia to become associate editor, with his cousin, Dr. S. W. Butler, of the MEDICAL AND SURGICAL REPORTER. In this relation he remained for two years, when he returned to Essex, where he was continuously occupied in his profession until a few weeks before his death. Dr. Butler was for eight years secretary of the Vermont Medical Society, and for three years its President. He was also a member of the American Medical Association and on its committee of hygiene. For the past six years he was a member of the Vermont State Board of Supervisors of the Insane, and for the past three years one of the U. S. Pension Examiners.

Among his published medical monographs are the following: "The Physiological Properties and Therapeutic Action of Veratrum Viride," "Cerebro Spinal Meningitis," "New Remedial Agents," "Diphtheria," "Locality of Consumption in Vermont," "Hygiene of the Farm," "Decadence of the Human Race," "Intoxication by Alcohol."

Dr. Butler leaves a widow and two children, Rev. E. P. Butler, of Lyme, N. H., Mrs. A. M. Granger, wife of Dr. F. C. Granger, of Randolph, Mass.

ENTERED AS SECOND-CLASS MAIL MATTER AT PHILADELPHIA P. O.

DETROIT COLLEGE OF MEDICINE.

SESSION 1888-89.

Clinical and Practical teaching are made an important feature of this College. Clinical instruction is given daily at HARPER, ST. MARY'S and ST. LUKE'S HOSPITAL at the COLLEGE, at COLLEGE EYE and EAR INFIRMARY, ST. MARY'S FREE EYE and EAR INFIRMARY, and at the three FREE DISPENSARIES. The facilities offered by this college are unsurpassed for the practical study of MEDICINE, SURGERY, OBSTETRICS, GYNÆCOLOGY, DISEASES OF CHILDREN, GENITO-URINARY, and ORTHOPÆDIC SURGERY, OPHTHALMOLOGY and OTOLOGY, DERMATOLOGY and LARYNGOLOGY.

REGULAR SESSION opens on Wednesday, September 26, and continues six months. During the session the Professors will take special pains to examine the Students upon the subjects of the previous lectures.

SPRING SESSION begins March 27th, 1889, and closes June 17th.

FEES.—Matriculation fee, $5; Fees for Regular Session, $50; Spring Session, $10, to those who attend the regular term, to all others, $25; Hospital Fee, $10; Graduation Fee, $30; Perpetual Ticket, $100.

For further particulars, and for College Circular, apply to

H. O. WALKER, M.D., Secretary,

33 Lafayette Ave., Detroit, Mich.

HORSE AND CARRIAGE
FOR SALE.

A physician in Philadelphia who is cutting off his visiting practice wishes to sell a valuable mare and a first-class Germantown wagon, one year old. Harness and saddle, and rugs and an old sleigh can go together at a low price.

Address,

Our New Lens Front, or Magnifying **Clinical Thermometers,** with **Indestructible Register** and **Ineffaceable Scale,** are the best and cheapest in use. Thermometers, Barometers, and Urinometers of all kinds and of the best makes.

Condensed and Illustrated Price List of 32 pages mailed to any address, **Free.** Full Catalogues of 172 pages for Fifteen Cents in Stamps. Mention this Journal.

BURN-BRAE.

This Hospital, founded by the late R. A. Given, M.D., 1859, and designed for the care and treatment of a limited number of cases of **Mental** and **Nervous Disorders,** is located at Clifton Heights, Delaware Co., Pa., a few miles west of Philadelphia. Primos Station, on the Philadelphia and Media Railroad, is within less than ten minutes' walk.

Burn-Brae has been in operation for more than a quarter of a century, and numbers its friends in all sections of the country. With **extensive grounds,** handsomely laid out, building attractive in appearance, a wide and varied view, bed-rooms large, cheerful, and well furnished, heating facilities perfect, light abundant, with constant professional supervision, **Burn-Brae** offers, for the care and treatment of its inmates, a pleasant, safe and healthful HOME.

Resident Medical Officers:

J. WILLOUGHBY PHILLIPS, M.D, S. A. MERCER GIVEN, M.D.

Western Pennsylvania Medical College,

City of Pittsburgh.

The *Regular Session* begins on the last Tuesday of September and continues six months. During this session in addition to four Didactic lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon two regular courses of lectures is requisite for graduation.

A three years graded course is also provided. The *Spring Session* embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects: this session begins the Second Tuesday in April and continues ten weeks.

The laboratories are open during the collegiate year for instruction in Chemistry, Microscopy, practical demonstrations in Medical and Surgical Pathology, and lessons in Normal Histology.

Special importance attaches to the superior clinical advantages possessed by this college. For particulars see annual announcements and catalogue, for which, address the Secretary, Prof. W. J. ASDALE, 2107 Penn. Avenue, Pittsburgh.

THERAPEUTICS OF DIPHTHERIA.[1]

BY A. JACOBI, M.D.,
CLINICAL PROFESSOR OF DISEASES OF CHILDREN IN THE COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK, ETC.

Mr. President:—You have conferred upon me the honor of an invitation to make some introductory remarks to your discussion on the treatment of diphtheria. This invitation I was anxious to accept, if for no other reason than to see the profession of Philadelphia at their home, and at work. That I should bring anything new to you, or striking, I never for a moment believed, since I was ever in the habit of reading your books and journals, and the proceedings of your societies. But it pleased me to infer from the demand that I should appear before you, that I was, to a certain extent, considered one of you, and to prove by my willingness to come that I appreciated the honor offered.

When I considered the subject which is to be the topic of your deliberations this evening, and remembered the vastness of its literature, it became clear to my mind that a digest, even so small, of what has been written, would fill more than many evenings, and still fall short of accomplishing the object in view. I was aware that I must not come here with literature. You will excuse me, therefore, for only detailing in plain language some of the facts gathered in my contact with diphtheria, these thirty years, and the therapeutical measures which I have learned to appreciate and to practice. Thus I shall not touch upon the large number of panaceas which have ascended like rockets and never were seen again.

[1] A paper read at the meeting of the Philadelphia County Medical Society, May 23, 1888.

Diphtheria is a contagious disease. Severe forms may beget severe or mild forms. Mild cases may beget mild or severe cases. There is probably no spontaneous origin of diphtheria, any more than there is a spontaneous origin of cholera or scarlatina. What has been called follicular amygdalitis (or "tonsillitis") is diphtheria in many, perhaps most, instances. It is seldom dangerous to the patient, because the tonsils have but very little lymph communication with the rest of the body. But the diphtheritic variety of follicular amygdalitis is also contagious. This mild variety is that from which adults are apt to suffer. It made me proclaim the warning that there is as much diphtheria out of doors as there is in doors; as much out of bed as in bed. With this variety the adult is in the street, in business, in the schoolroom, in the railroad car, in the kitchen and nursery. With this variety, parents while complaining of a slightly sore throat, kiss their children. Wherever it is suspected, it ought to be looked after. Where it is seen it ought to be isolated and treated, less perhaps for the sake of those who are sick, than of those who are in serious danger of being infected. This is the more necessary, as this form is apt to last long and give rise to repeated attacks. But it is not only the mild variety which is liable to last long. Serious, undoubted cases are also apt to last for weeks, and some of them months. As long as they do persist they are contagious.

These reminiscences and quotations from former writings must justify the preëminent place I claim for preventive treatment.

Those sick with diphtheria, severe or mild, must be isolated. If barely possible, the other children ought to be removed from the house. This can but rarely be done in the homes of the poor, in the densely populated districts. A great charity is still waiting for

its consummation, viz., that of erecting buildings, dormitories, and playrooms for those who ought to be temporarily exiled from their infected homes. A suggestion of mine, before the New York State Medical Society in its meeting of 1882, resulted in the erection of the Willard Parker Hospital of New York, for the benefit of those suffering from scarlatina and diphtheria. The erection of a sufficient number of temporary homes would be a still greater blessing to the poor, and a greater protection to the public at large. If it be impossible to send the well children away, let them remain outside the house, in the air, as long as feasible, and with open bedroom windows during the night, in the most distant part of the house; during the winter on a lower floor. Their throats must be examined every day, and their rectal temperatures taken by the mother, so that the physician may be called on the occurrence of but slight changes. The few minutes spent in this way are amply repaid by the safety they may accomplish. The attendants upon cases of diphtheria must have no intercourse with the well children; though a brief visit of the physician may not render him sick, or dangerous to others, a long exposure affects him or a nurse to a greater or less degree.

The well children of a family in which there is diphtheria, must not go to school or church. Schools must be closed when a number of pupils have been attacked; or better still, when there is an epidemic, though it may not yet have affected the school children to a great extent; the teachers ought to be taught how to examine throats, and directed to do so every morning, and send home those children who are suspected.

When an attack of diphtheria has made its appearance, it is well enough to examine the hygienic condition of the house with its deteriorating influences on the general health of the inmates, and to look after the source of the case in the persons of friends, attendants, and help. A family with children ought to insist upon the occasional inspection of the throats of their servants; those with chronic pharyngeal catarrh must not be hired. A seamstress, or laundress coming for an occasional day's work, sick nurses, children's nurses, and cooks, ought to be examined from time to time, the more so, the more such people are inclined to conceal slight troubles, for obvious reasons. The opportunities for infection are so numerous that it is impossible to sail absolutely free from it. It is easy to imagine how many cases of diphtheria are liable to be disseminated by teachers, shopkeepers, restaurant keepers, barbers, and hairdressers.

In times of an epidemic, every public place, theatre, ball-room, dining-hall, and tavern ought to be treated like a hospital. Where there is a large conflux of people there are certainly many who carry the disease. Disinfection ought to be enforced at regular intervals. In this respect I can but repeat what I said in my treatise (p. 172) and Pepper's *Cyclopædia* (I. 697). Public vehicles must be treated in the same manner after a suspicious case has been carried; that it should be so when a case of small-pox has happened to be conveyed in them, appears quite natural. Livery stable keepers who would be anxious to destroy the germ of small-pox in their coaches, must learn that diphtheria is as dangerous a passenger as variola, and what is correct in the case of a poor hack, is more so in a railroad car, whether emigrant or Pullman. I have seen many cases coming to and leaving the city in them. They ought to be thoroughly disinfected in times of an epidemic at regular intervals, for the highroads of travel have always been those of epidemic diseases. Still, can that be accomplished? Will not railroad companies resist a plan of regular disinfections, because of its expensiveness? Will there not be an outcry against this despotic violation of the rights of the citizen, the independence of the money bag? Certainly there will be, exactly as there was when municipal authority commenced to compel parents to keep their children from school when they had contagious diseases in their families, and when small-pox patients were arrested because of their endangering the passengers in a public vehicle, or taken to a fever hospital for the protection of their neighbors. In such cases it is not society, or the State, that tyrannizes over the individual, it is the individual that endangers society.

To what extent the infecting substance may cling to surroundings, is best shown by the cases of diphtheria springing up in premises which had not seen diphtheria for a long time, but had not been interfered with; and best, perhaps, by a series of observations of auto-infection. When a diphtheritic case has been in a room for some time, the room, bedding, curtains, and carpets, are infected. The child is getting better, has a new attack, may again improve, and is again stricken down. Thus I have seen them die; but also improve immediately after being removed from that room or house. If barely possible, a child with diphtheria ought to change its room and bed every few days.

To other rules of protection and disinfection, both private and public, including the prohibition of public funerals, I allude only for the purpose of referring to the admirable rules published in its *Bulletin* No. 10, of September 6, 1879, by the National Board of Health, and copied in my treatise on diphtheria, New York, 1880, and my article on diphtheria in Pepper's *System of Practical Medicine*, vol. I. p. 698.

Prevention can accomplish a great deal for the individual. Diphtheria will, as a rule, not attack a healthy integument, be this cutis or mucous membrane. The best preventive is, therefore, to keep the mucous membrane in a healthy condition. Catarrh of the mouth, pharynx and nose must be treated in time. Many a chronic nasal catarrh, with big glands round the neck, requires sometimes but two or three regular salt-water injections (1:130) into the nose, and gargling if the children be large enough to do so. The addition of one per cent. of alum will often be found useful. This treatment, however, must be continued for many months, and may require years. Still there is no hardship in it, and no excuse for its omission. The nasal spray of a solution of nitrate of silver, 1:500 or 1000, will accelerate the cure, and not infrequently has a treatment which was considered obsolete when I was young, been of great service to me. It consists in the internal administration of the tincture of pimpinella saxifraga. It is certainly an efficient remedy in subacute and chronic pharyngitis and laryngitis. I generally give it to adults, diluted with equal parts of glycerine and water, a teaspoonful of the mixture every two or three hours, with the proviso that no water must be taken soon after.

Large tonsils must be resected in times when there is no diphtheria. During an epidemic every wound in the mouth is liable to become diphtheritic within a day, and such operations ought to be postponed if feasible. The scooping of the tonsils, for whatever cause, I have given up since I became better acquainted with the use, under cocaine, of the galvano-cautery. From one to four applications to each side, or to the post-nasal space, are usually sufficient for every case of enlarged tonsils or lacunar amygdalitis. It is advisable to cauterize but one side at a time, to avoid inconvenience in swallowing afterward, and to burn from the surface inward. Cauterization of the centre of the tonsils may result in swelling, pain, and suppuration, unless the cautery is carried entirely to the surface; that is to say, the scurf must be on, or extend to the surface. Another precaution is to apply the burner cold, and heat it *in situ*.

Nasal catarrh and proliferation of the mucous and submucous tissue may require the same treatment, but in my experience the cases which require it are less frequent than cases in which the tonsils need correction. The presence of glandular swellings round the neck must not be tolerated. They and the oral and mucous membranes affect each other mutually. Most of them could be avoided if every eczema of the head and face, every stomatitis and rhinitis resulting from uncleanliness, combustion, injury, or whatever cause, was relieved at once. A careful supervision of that kind would prevent many a case of diphtheria, glandular suppuration, deformity or phthisis.

For its salutary effect on the mucous membrane of the mouth, chlorate of potassium, or sodium, which is still claimed by some to be a specific, or almost so, is counted by me amongst the preventive remedies. If it be anything more, it is, in a case of diphtheria, an adjuvant. It exhibits its best effects in the catarrhal and ulcerous condition of the oral cavity. In diphtheria it keeps the mucous membrane in a healthy condition, or restores it to health. Thus it prevents the diphtheritic process from spreading.

Diphtheria is seldom observed on healthy, or apparently healthy, tissue. The pseudo-membrane is mostly surrounded by a sore, hyperæmic, œdematous mucous membrane. Indeed, this hyperæmia precedes the appearance of the diphtheritic exudation in almost every case. The exceptions to this rule consist of those cases in which the virus may take root in the interstices between the normal tonsillar epithelia, pointed out by Stoehr but a few years ago. Indeed, many cases of throat disease occurring during the prevalence of an epidemic of diphtheria, are but those of pharyngitis which under favorable circumstances may develop into diphtheria. These throat diseases are so very frequent during the reign of an epidemic, that in my first paper on diphtheria (August 11 and 18, 1860, *Amer. Med. Times*) I based my reasoning on 200 cases of genuine diphtheria, and 185 of pharyngitis, without a visible membrane.

These cases of pharyngitis, and those of stomatitis and pharyngitis accompanied by the presence of membranes, are benefited by the local and general effect of chlorate of potassium. The surrounding parts being healthy or returning to health, the membrane remains circumscribed. The generally benign character of purely tonsillar diphtheria, which

is apt to run its full course in from four to six days, has in this manner contributed to secure to chlorate of potassium the reputation of being a ready, *the*, remedy in diphtheria. The dose of the salt must not be larger than 15 grains (1 gramme) for an infant a year old, not over 20 or 30 (1.5–2.0) for a child from three to five years old, in the twenty-four hours. An adult must not take more than 1½ drachms (6 grammes) daily. These amounts must not be given in a few large doses, but in repeated doses and at short intervals. A solution of one part in sixty will allow a teaspoonful every hour, or half a teaspoonful every half hour in the case of a baby one or two years old.

It is not too late yet to raise a warning voice against the use of larger doses. Simple truths in practical medicine do more than simply bear repetition, they require it. For though the cases of actual chlorate of potassium poisoning are no longer isolated, and ought to be generally known, fatal accidents will still occur even in the practice of physicians. When I experimented on myself, with half ounce doses, thirty years ago, the results were some gastric, and intense renal irritation. The same were experienced by Fountain, of Davenport, Iowa, whose death from an ounce of the salt has been impressively described in Alfred Stillé's *Materia Medica*, from which I have quoted it in my treatise on diphtheria. His death from chlorate of potassium induced me to prohibit large doses as early as 1860. In my contribution to Gerhardt's *Handbuch der Kinderkrankheiten*, vol. II, 1877, I could speak of a series of cases known to me personally. In a paper read before the Medical Society of the State of New York in 1879 (*Medical Record*, March 15), I treated of the subject monographically, and alluded to the dangers attending the promiscuous use of the drug, which has descended into the ranks of domestic remedies; and, finally, in my treatise (New York, 1880) I collected all my cases, and the few then recorded by others Since that time the recorded cases have become quite numerous, and but a few days ago a few new ones were related before the Practitioners' Society of New York. The facts are undoubted, though the explanations may differ. The probability is that death occurs from methæmoglobinuria produced by the presence of the poison in the blood; though Stokvis, of Amsterdam, has tried, by a long series of experiments, to fortify my original assumption that the fatal issue is due to acute nephritis.

The attempt at forming indications for the treatment of patients with diphtheria—I refuse to say treatment *of* diphtheria—based upon preconceived or acquired ideas as to the nature and causes of diphtheria, are all futile. We know that many cases are undoubtedly of local origin; but there are those in which we require no other proof for its original infectious character than the fact that there is a period of incubation. But all that is indifferent, in view of the fact that the cases we are called upon to treat are, as a rule, or have become, both local and constitutional. It is these we have mostly to deal with.

There is no better proof of the non-existence of a specific in diphtheria than the fact that the pharmacopœia has been exhausted to find one, and new remedies, legitimate and illegitimate, are being recommended all the time as panaceas. While there are certain indications resulting from the characteristics common to all, every case must be treated on general principles, which must be applied to the prominent individual features. When there is a high temperature in the beginning, it requires all the tact of a good physician to judge of the advisability of reducing it by antifebriles, such as sponging, warm bathing, cold bathing, antipyrine, antifebrine, or the subcutaneous use of the carbamide of quinia. Convulsions may demand active treatment, such as chloroform inhalations, or chloral hydrate internally, or in the rectum. Vomiting, or other cerebral symptoms, may ask for liquids, or smaller or larger doses of opiates. A very quick and feeble pulse may require a few large doses of a heart stimulant, digitalis, strophanthus, or sparteine in the very beginning.

Renal complications are frequent, and occur at an early time. The majority of cases terminate favorably; in some a large amount of albumin will be eliminated in the course of a few days and disappear shortly. But whether or not your individual case will be of that nature, you do not know, and in time of danger nothing must be taken for granted. Milk or farinaceous diet, plenty of water, or, better, Poland, Bethesda, Seltzer, Appollinaris, or Vichy, warm bathing, warm feet, a few good doses of calomel, a number of hourly or two-hourly small doses of opium—which are better than those of digitalis—and nitroglycerine, will often prove beneficial. If a diffuse nephritis, such as is more frequently met with in scarlatina, be the result, it impairs the prognosis and requires further treatment conducted on general principles.

To what extent local treatment, if it be possible to employ it, is effective, can best

be seen on external diphtheritic surfaces, such as the cutis denuded by vesicatories, the inguinal regions sore with intertrigo, the vagina, circumcision wounds, or tracheal incisions. I have tried almost everything which has been recommended for these conditions, but am most pleased with the effect of iodol, or iodoform powdered, or one part with eight or ten of vaseline. Powders of subnitrate of bismuth, boric acid, or salicylic acid with fifteen or twenty-five times its quantity of starch, have not given me the same satisfaction.

The treatment of diphtheritic conjunctivitis requires also nothing but local measures. It consists in the application of small ice-bags, or iced cloths which must be changed every few minutes, and the frequent instillation of a saturated solution of boric acid, with or without atropia.

The local treatment of the pseudo-membranes of the fauces is a subject of great importance. To look upon them as an excretion which needs no interference, is incorrect. If it were possible to remove or destroy them, it would be a great comfort; but they can be reached only in certain places, and just in those in which they do least harm. Pseudo-membranes on the tonsils are the least dangerous, for their lymph communication with the rest of the body is very scanty. Thus almost all forms of tonsillar diphtheria are amongst the most benign, at least as long as the process does not extend. Most cases of the kind run their mild course in from five to seven days, and it is just these which have given rise to the many proposals of tearing, scratching, cauterizing, swabbing, brushing, and burning. There are cases which do not show the harm done. The fact is that neither the galvano-cautery nor carbolic acid, nor tannin and glycerine, nor perchloride or subsulphate of iron can be applied with leisure and accuracy to the very membrane alone, except in the cases of very docile and very patient children. In almost every case the surrounding epithelium is getting scratched off or changed, and thus the diphtheritic deposit will spread. Besides, the membrane of the tonsil is changed surface tissue, as it always is wherever the epithelium is pavement, and not deposited upon the mucous membranes from which it might be easily detached. Whatever is done must be accomplished without violence of any kind. If nasal injections be found advisable they can be made to wash the posterior pharynx and the tonsils sufficiently, so as to render the special treatment directed to the throat absolutely useless. Besides, it is easier, and meets with less objection, and gives rise to less exhaustion than the forcible opening of the mouth. This is of very great importance, as I shall show in connection with the local treatment of the nasal cavity. Where it is possible to make local applications without difficulty, the membrane may be brushed with tincture of iodine several times daily, or a drop of rather concentrated carbolic acid. Of powders I know only one, the application of which is not contraindicated, viz., calomel. Even this may irritate by its very form. Everything dry irritates and gives rise to cough or discomfort. Whatever has, besides, a bad taste or odor, such as sulphur, iodoform, or quinia, must be abhorred.

For the purpose of dissolving membranes papayotin, or papain, has been employed. It is soluble in twenty parts of water, and may be injected, sprayed, or brushed on. I have used it in greater concentration, in two or four parts of water and glycerine, in the nose, throat, and through the tracheotomy tube, in the trachea. One of the irrepressible drug manufacturers and advertisers pushes the claims of some modification of the drug, which he calls papoid. For the same purpose trypsin is preferred by others. The mode of its applications appears to be the reverse of indifferent. Only lately, I have seen in the practice of one of our best known practitioners, papayotin applied in powder, which resulted in constant irritation of the throat, while the patient otherwise was convalescent. The pharyngeal hyperæmia and slight exudation disappeared when mild alum washes were substituted.

Steam.—Its inhalation is useful in catarrh of the mucous membranes, and in many inflammatory and diphtheritic affections. On mucous membranes it will increase the secretion and liquify it, and thus aid in the throwing off of the pseudo-membranes. Its action is the more pronounced the greater the amount of muciparous follicles under or alongside a cylindrical or fimbriated epithelium. Thus it is that tracheo-bronchial diphtheria, so-called fibrinous bronchitis, is greatly benefited by it. Children affected with it I have kept in small bath-rooms for days, turning on the hot water, and obliging the patient constantly to breathe the hot clouds. Several such cases I have seen recover with that treatment. Atomized *cold* water will never yield the same result. Nor have I seen the patent inhalers do much good. Still, where the surface epithelium is pavement rather than cylindrical, and but few muciparous follicles are present, and the

pseudo-membrane is rather immerged in, and firmly coherent with, the surface—for instance, on the tonsils and the vocal cords—the steam treatment is less appropriate. On the contrary, moist heat is liable in such cases to favor the extension of the process by softening the hitherto healthy mucous membrane. Thus it takes all the tact of the practitioner to select the proper cases for the administration of steam, not to speak of the judgment which is required to determine to what extent the expulsion of air from the steam-moistened room or tent is permissible.

Steam can be properly mixed with medicated vapors. In the room of the patient water is kept boiling constantly over the fire-place, provided the steam is prevented from escaping directly into the chimney; or on a stove (the modern self-feeders are insufficient for that purpose and abominations for every reason); or over an alcohol lamp if we cannot do better, but not on gas if possible, because of the large amount of oxygen which it consumes. Every hour a tablespoonful of oleum terebinthinæ, and perhaps also a teaspoonful of carbolic acid, is poured on the water and evaporated. The air of the room is filled with steam and vapors, and the contact with the sore surfaces and the respiratory tract is obtained with absolute certainty.

The secretion of the mucous membranes is sometimes quite abundant under the influence of steam, but still is, like that of the external integuments, increased by the introduction of water into the circulation. Therefore, drinking of large quantities of water, or water mixed with an alcoholic stimulant, must be encouraged. Over a thoroughly moistened mucous membrane the pseudo-membrane is more easily made to float, and to macerate.

It was for this purpose that pilocarpine, or jaborandi, was highly recommended. Guttmann recommended it as a panacea in all forms of diphtheria. There is no doubt that the secretion of the mucous membrane is vastly increased by its internal application, and by repeated subcutaneous injections of the muriate or nitrate of the alkaloid, but the heart is enfeebled by its use. I have seen but few cases in which I could continue the treatment for a sufficient time. In many I had to stop it because after some days of persistent administration I feared for the safety of the patients. Thus, as early as at the meeting of the American Medical Association at Richmond, eight years ago, I pointed out the exaggerations in the statements of Guttmann. There will be but exceptional cases in which pilocarpine will be tolerated long enough to do good. It is one of the remedies with which we may cure our case and will kill our patient.

Diphtheria of the nose is apt to terminate fatally unless energetic treatment is commenced at once. This treatment consists in persevering disinfection of the mucous surface. The disinfecting procedure must not be omitted long because of the general sepsis resulting from rapid absorption from the surface, which is supplied with lymph ducts and small, superficial blood-vessels to an unusual extent. Disinfectant injections must be continued every hour, for one or more days. If they are well made, the consecutive adenitis, especially that about the angles of the lower jaw, is soon relieved and the general condition improved. But there are cases in which the lymph bodies are not the main gates through which constitutional poisoning takes place, but the blood-vessels alone. In the incipient stage of such cases the discharge from the nostrils is more or less sanguineous; in them the blood-vessels, thin and fragile, carry the poison inward with great rapidity.

In a few cases injections are unsuccessful. They are those in which the whole nasal cavity is filled with membranous deposits to such an extent as to require forcible treatment. Sometimes it is difficult to push a silver probe through it. That procedure may be repeated, the probe dipped in carbolic acid, or wrapped in absorbent cotton moistened with carbolic acid of 50 or 90 per cent. After a while injections alone will suffice. But now and then the development of pseudo-membranes is very rapid, a few hours suffice to block the nostrils again, and the difficulty is the same.

[TO BE CONTINUED.]

REMOVAL OF THE UTERINE APPENDAGES AS A REMEDIAL MEASURE.[1]

BY S. T. DAVIS, M.D.,
CONSULTING SURGEON TO ST. JOSEPH'S HOSPITAL, LANCASTER, PA.

It is not expected that the profession will be taught anything new on this important subject, but the recital of this remarkable case, with the very satisfactory results, may stimulate others to consider more seriously and thoroughly the propriety of extending to a large class of sufferers the benefits of a surgical operation as a remedial measure where medicine has hopelessly failed to give more than temporary and unsatisfactory relief.

[1] Read before the Medical Society of the State of Pennsylvania, June 6, 1888.

In September, 1887, Dr. Bushong, of New Holland, Lancaster county, Pa., consulted my brother, Dr. M. L. Davis, Medical Director of the Hospital, in relation to the admission of Miss B. W., who had been a patient of his for several years, with a view of having Battey's operation performed, if thought advisable. After her admission my attention was called to her case in consultation, when the following history was elicited:

Age, 21; date of admission, October 18, 1887; menstruated at 10½ years, with pain; father living, age, 51, always healthy; mother died at 51 from disease of the heart, following rheumatism; brothers living, 4 (28, 26, 22 and 13 years of age), all in good health; brothers dead, 3 (one 5 years old, of diphtheria, one 16 months old, of scrofula, and one infant, cause unknown); sisters living, 8 (35, 33, 20, 24, 29, 17, 14 and 11 years of age), all in good health but two; sisters dead, 1 (5 years old), of diphtheria. Paternal grandfather died at 76, of old age; paternal grandmother died at an advanced age, cause of death unknown. Maternal grandfather died at 52, of consumption; maternal grandmother died at 71 years of age, of consumption. The sister, 33 years old, has heart trouble, the result of rheumatism, and the one 24 years old suffers with dysmenorrhœa, though not in an aggravated form. The mother of the patient and four of her father's sisters were sufferers with the same disease. In the Spring of 1879 she received an injury from a direct blow in the region of the perineum, which was followed by pain, swelling and incontinence of urine; and the latter was followed in a few days by retention, the patient frequently not urinating for 24 or 30 hours. In September of the same year she fell a distance of thirty-five or forty feet, injuring the abdomen, back and side, and was confined to her bed for some time. In January, 1880, she again had a fall of twenty feet, which produced displacement of the uterus and confined her to bed for several weeks. In May of the same year she was struck a violent blow between the shoulders. In January, 1881, she contracted measles, recovery from which was slow, and was followed by an aggravation of the uterine symptoms. Shortly after partial recovery, rheumatism set in and was severe for two weeks; this was followed by paralysis of the right arm, leg, and right side of the face.

Dr. Bushong, her attending physician at the time, regarded the cause of the paralysis as reflex. Improvement began in about two weeks. She has had two similar attacks since, and recovered from them in about the same length of time. In March, 1881, at one of her menstrual periods, she had convulsions which were violent in form, and returned daily for three weeks. Since that time (about six years), they have occurred at nearly every menstrual period, and at the last one preceding the operation, I was called in consultation with the Staff Physician, who was apprehensive that death would take place at any time, as she had been in an apparently comatose condition for over twenty-four hours. The condition was not of that hysterical variety so often met with in uterine diseases and general prostration, but was of a hystero-epileptoid character, and at one time she remained in an unconscious condition for three weeks, from which she could not be aroused even by the strongest safe electric current. As before stated, menstruation appeared in 1879, when she was ten and a half years of age, and about the time that the injury to the perineum was received. During the first and second periods, the latter following the former in one month, she suffered severe pain, which continued without any remission as long as the flow lasted. After this, menstruation did not occur for six months, and then was accompanied with much more suffering than on the two former occasions, and continued for several days after the discharge ceased. From this time on the periods were irregular, sometimes recurring every month for three or six months, again being absent for a like period. The pain and general nervous debility gradually increased with each menstrual epoch, until, for the last four years, she became a helpless invalid, bedridden and dependent upon those around her for everything, and dependent upon her faithful physician even to relieve the bladder morning and evening.

From the date of the first appearance of her menses until the day she was operated upon, she was confined to her bed in all, five years, seven months and thirteen days. All means had been exhausted for her relief, short of removing the ovaries. In 1883, 1885 and 1887 she was with difficulty taken to a college hospital in Philadelphia, where forcible dilatation of the os and urethra was performed. The therapeutics of dysmenorrhœa had all been gone through with, and for the prolapsus a long list of unique-shaped pessaries had been worn. All without benefit.

Operation:—My brother, Dr. M. L. Davis, assisted by the writer, Dr. Bushong and the Hospital Staff, did the operation by abdominal incision in the median line, all antiseptic precautions being observed in detail. Both ovaries and tubes were found diseased, and bound down with the products of oft-repeated

subacute inflammations. Strong silk ligatures were applied as close to the uterus as was possible, the diseased organs removed and the pedicles dropped. The abdominal wound was closed with silk sutures, penetrating as near as possible to the peritoneum without injuring that membrane, and supported with strips of plaster. A soft, carbolated cotton pad, secured with a well-fitting bandage, completed the operation, which lasted but half an hour. The uterus was placed in, as near as possible, its normal position, and kept in place by a soft antiseptic tampon, the object being to get rid of the prolapsus by adhesion of the stumps to the peritoneum, at the point where the ovaries were enucleated. The patient was placed in bed on her back, sufficient anodynes were given to relieve pain, the bladder was relieved by the use of the catheter every four or five hours, and recovery was complete and rapid, without one untoward symptom. The abdominal wound healed by first intention, not even one drop of pus forming around the sutures. Since her admission to the hospital she menstruated every four weeks, the time for the fourth period coming on three weeks after the operation, at which time she suffered some pain, but was able to bear it without the use of anodynes—an unknown occurrence in the history of her long list of sufferings since she first cast an ovum, in 1879. When the second and third periods came round she had but little if any pain, simply languor. On the day of the operation she weighed about seventy-five pounds; to-day she weighs one hundred and twenty. The uterus is in almost its normal position. The catheter is no longer needed, although there is at times some slight irritability of the bladder, which will, no doubt, in the absence of the monthly congestions, yield to the power of nature to heal itself when not interfered with. I doubt very much if there is a physician within the sound of my voice who can not recall more than one case occurring in his practice in years gone by, in which this comparatively simple and safe operation would have cured more than one of his patients suffering with a complication of diseases of the pelvic organs—one in which the remedies usually prescribed tended only to aid the disease in undermining the nervous system. Some may take exception to the terms simple and safe, as applied to the operation. When using these terms I desire to be distinctly understood as referring to the operation by abdominal section, which, in my humble opinion, has more claims for simplicity and safety than either of the other methods chosen by such distinguished gynecologists as Dr. Goodell, of Philadelphia, with fifty-three operations during the past year and but a single death, and Dr. W. Gill Wylie, of New York, with one hundred and fifteen operations, and only six deaths. Considering the deplorable condition of this class of patients, as a rule, the percentage of recovery is so large that it seems to me to be malpractice to allow a well-marked case for the operation to suffer on without offering the only means of relief.

TUBERCULAR MENINGITIS.

BY G. W. GARRISON, M.D.,
UTICA, OHIO.

On Thursday, April 12, 1888, I was called to see D. S., fourteen months old, and found the little patient feverish and quite restless, with her gums swollen and her bowels torpid. I diagnosticated her condition to be a mild catarrhal fever. I gave her a mercurial laxative every two hours in a teaspoonful of syrup of wild cherry bark, with half a drop of tincture of aconite and two drops of tincture of gelsemium for the first twenty-four hours.

On the morning of the 13th, the patient was much the same. She had had several alvine evacuations during the night; her pulse was 120; her temperature, 103°; her respiration, short and frequent. She was rather disposed to be dull and stupid. I continued the former treatment with fluid diet, etc.

April 14.—The child's condition was much the same; she had less fever, but was still dull and drowsy, although not so irritable as before; her pulse was 110; her temperature, 102°. I continued the former treatment, but omitted the mercurial, as it was acting too much on the bowels. On the morning of the 15th, the symptoms remained much the same as before, and I could not understand why the disease was so hard to break up. For the next four days there was no apparent change in her condition for the better, and I became somewhat anxious about my little patient's recovery.

On the afternoon of the 20th, the mother reported the child's bowels to be again torpid, and requiring more attention than formerly. Vomiting and coughing would ensue immediately on arousing from sleep, and she had been very stupid and sleepy during the past twenty-four hours. Her eyes were partially closed when she fell into a nap, and her head was thrown back

(opisthotonus). About midnight she had a convulsion, and after that the vomiting became more frequent.

At this visit I ordered cold applications to the head, and:

℞ Potassii bromidi.....gr. j
Potassii iodidi.....gr. ¼
Misce. Sig. Give in a teaspoonful of wild cherry syrup every 3 or 4 hours.

I also ordered an enema of oil, one tablespoonful, and turpentine, 20 drops, to move the bowels.

The family history of this child may be related here. On the paternal side, some two or three children had died when quite young, and two grown brothers, aged 35 and 37 years, had died recently of tuberculosis. On the maternal side, the grandmother had died of consumption some half dozen years or so ago. So after treating my little patient for several days without any improvement, I was convinced that I was in an error in the first diagnosis, and informed the parents of my opinion, and suggested a consultation. This being agreed to, we sent for Dr. A. T. Speer, of Newark, O., on the morning of April 21. When we visited the child together in the afternoon, the child roused up and looked brighter than I had seen her look for several visits past. She played with Dr. Speer's watch and keys, but when we made a close examination she became fretful and nervous; and while we were in an adjoining room consulting, she began dozing, and threw her head back, half closing her eyes; but soon she became startled at something and roused up, coughing and crying as usual, and then began to vomit; then she fell back into a sleep again. Dr. Speer fully concurred in my opinion as to the pathological condition.

Our treatment now was: Internally, syrup ferri iodidi, five drops every four hours, alternating with gr. 1-40 of calomel and gr. j. of sugar of milk, rubbed up together; locally:

Iodoformi.....℥j
Adipis.....℥vij
M. Ft. unguent.
Sig.—Apply to entire scalp every eight hours, and cover with oiled silk and a night-cap.

Her diet was strictly liquid.

On the morning of April 22, there was a decided improvement for the better. Opisthotonus was no longer observable, the vomiting was less frequent, the cough much the same, and had she not been disturbed with a teaspoon coming at her statedly, I believe she would not have vomited any more. I discontinued the powders at this visit, and ordered one-eighth of a grain of iodide of potash to be given in a tablespoonful of water, *ad libitum*, or as often as every two hours, if she did not call for a drink. I continued the topical application of iodoform as before, for I believed that it had dissipated about all the alarming cerebral symptoms. On the 23d, the patient seemed much better, and was more rational than at any of my former visits. The same treatment was continued. This condition continued much the same at my visits on the 24th, 25th, 26th and 27th, until the morning of the 28th, when I noticed an irritable hacking cough, followed by a peculiar groan. On examining the lungs I discovered some crepitation of the left lung, posteriorly and inferiorly. I now ordered the iodoform and lard to be applied all over the thorax every eight hours, with the same precautions as when applying it to the head—where it had been discontinued for three days previously. This local treatment was kept up for three days, with calomel gr. 1-20, morph. sulph. gr. 1-100, sugar of milk gr. j, dry on the tongue every three hours. This had a very good effect in relieving all the difficulty and shortness of breathing, so that the little patient from this time (April 30 to May 2) made a rapid recovery, with all her mental faculties intact—something which it is not often a physician's good fortune to witness when having such an unfavorable family history as in this case.

I am no enthusiast over new remedies, and not prone to adopt modes of treatment other than those laid down in our text-books; but the suggestion of Dr. Speer, to use iodoform to the scalp, was well supported by the reflection that iodoform is one of our very best alteratives, and the recollection of a number of articles in the medical periodicals on the efficacy of iodoform in cerebro-spinal troubles, appearing within the last year. I attribute to its effects the restoration of our little patient to health. On May 2, after three weeks close attention, the patient was regarded as recovered, which was a great blessing to a young and happy father and mother, while I was almost as grateful as they.

TREATMENT OF WOUNDS OF THE PALMAR ARCH WITH SHOT-BAG PRESSURE; A CASE.

BY MADISON REECE, M.D.,
ABINGDON, ILLINOIS.

The editorial in the REPORTER for June 2, brings to mind three cases of wounds of the palmar arch which strikingly support the position of the editor in regard to the treat-

ment there advocated. The difficulty to be encountered, I apprehend, is in producing bearable pressure. This was the trouble which M. Bosquet feared, and failed to meet. In the following case I give the method by which I overcame this difficulty:

September 5, 1879, Mrs. H. cut the superficial palmar arch of the left hand, on the radial side, while opening a can of fruit. The bleeding was considerable, and was arrested for a time with compression applied by the husband. The next day the hemorrhage recurred to such an extent that a physician was called. The bleeding was again arrested with pressure; but as it was badly borne it was relaxed, and during the night profuse and exhausting hemorrhage took place. By this time considerable swelling and infiltration of the tissues of the hand and wrist had also taken place, and the attending physician, believing it necessary to tie the arteries at the wrist, I was sent for in consultation.

Upon arriving at the patient's home, I found the doctor had remained all night, for the reason that the amount of pressure applied caused so much pain that it had to be frequently removed, and then the bleeding would begin immediately. The patient was a spare woman, anæmic, and very nervous.

It required no great amount of pressure to control the hemorrhage, and I suggested and put into operation the following device: A small bag four inches in length and two and a quarter inches in width was made and filled with bird-shot. The forearm was placed on an elevated pillow, and the shot-bag placed lengthwise on the wrist over the arteries. The pressure was well borne, giving no pain or uneasiness. The wound began to heal rapidly, and in four days the weight was removed, and no tendency of the bleeding to again show itself was manifested.

The attending physician was agreeably surprised at the result, as he was thoroughly convinced that nothing but tying the arteries would answer. I have treated three cases of wounds of the palmar arch in this way, with the same happy results. In other cases, in which the ends of the arteries could be easily secured, I have tied both ends; but where there is secondary hemorrhage and swelling, with infiltration of the parts, as in the case above related, I believe the equable, diffused, and easily adjustable pressure made by a bag of shot, will secure the best results.

—An association of colored physicians exists in Texas under the name of the Lone Star Medical Association. Its second annual meeting was held at Austin, May 14 and 15.

Society Reports.

PHILADELPHIA COUNTY MEDICAL SOCIETY.

Stated Meeting, May 23, 1888.

The President, J. Solis-Cohen, M.D., in the chair.

Dr. Joseph O'Dwyer, of New York, read by invitation the following paper on the use of

Intubation Tubes.

[Before reading his paper Dr. O'Dwyer exhibited tubes with a metallic attachment to replace the epiglottis in swallowing, one of them being so arranged with a spring that the finger might be introduced behind it as an extractor.

In order to illustrate through how small a space breathing can occur, he exhibited a specimen from a case in which there had been no choking of voice or other sign of laryngeal involvement.

Many fear that the tube will slip through into the trachea. A tube was exhibited *in situ*, in a three year-old larynx, showing that this accident cannot occur if the proper size of tube for the age be employed.]

The testimony of tracheotomists from the time of Bretonneau, has been uniformly in favor of canulas of large calibre. I have failed to find a single dissenting opinion on this question, yet very few have given any reason in support of their conviction, or entered into any arguments whatever on the subject, probably because they considered that none were necessary, as it appears so very reasonable that the artificial channel should approximate as nearly as possible to the normal lumen of the air-passages. I will refer to a few of the authorities on this subject before giving the reasons that led to the adoption of laryngeal tubes of so much smaller calibre than those generally used for the trachea.

If a large opening be preferable in one situation it certainly is in the other, the same argument applying to both. Bretonneau, for some reason which I have not been able to find, came to the conclusion that the canulas which he first devised were not large enough, and laid down the rule that "The artificial conduit should always have at least the normal diameter of the glottis of the subject." Trousseau endorsed this as an excellent precept, which should never be forgotten. Steiner says that as large a canula as possible should be used. The first point of importance insisted on by West, as influencing the result

of tracheotomy in croup, is the use of a large canula.

The author of the article on croup in Holmes's *System of Surgery*, says that "as a general rule, both openings in the canula should be sufficiently large to admit as much air as would pass through the rima glottidis in health."

The following is from Reynolds's *System of Medicine:* "No tube with less than a quarter of an inch diameter is sufficient to carry on respiration. At a year old such a tube cannot be introduced into the trachea; it would not be tolerated at two years old, so that at these ages some other means must be looked for to secure a passage for the air."

This author then discusses the question as to whether the want of success with tracheotomy in very young children is not due to the inability to secure a large enough opening. In answer to such assertions as the above, it is only necessary to state that the diameter of the lumen of the trachea at a year old is scarcely a quarter of an inch, and, furthermore, an adult can breathe comfortably while at rest through an opening of this size. I have at present a man under my care who has been wearing a canula in the trachea for the last seven months, the bore of the inner tube being exactly one-fourth of an inch in diameter. During part of this time he was obliged to breathe exclusively through the artificial opening, but then the least exertion, such as walking across the room, was sufficient to induce dyspnœa. Nature supplied this patient, who is of large stature, with a breathing-tube at least seven-eighths of an inch in diameter, and the surgeon substituted one having a breathing capacity of something less than one-twelfth of this. In other words, the area of a cylinder seven-eighths of an inch in diameter is a little more than twelve times that of one a quarter of an inch in diameter.

Had the surgeon who operated in this case placed himself on record, he must have taken extreme ground in favor of small canulas. Trousseau advocated larger canulas than were first used, on the ground that in some cases the improvement that at first succeeds the operation of tracheotomy soon gives place to a return of the dyspnœa, and attributes this result to the inadequate size of the canula employed, which does not provide for the permanent admission of a sufficient quantity of air. In illustration of this fact he says: "Place a quill in the mouth, and, closing the nostrils, endeaver to breathe entirely through it; at first you breathe easily enough, but soon your respiration becomes laborious, and at length you are fain to throw away the quill, and with open mouth once more to fill the lungs completely."

I have tried this experiment with a quill, the diameter of which was three-sixteenths of an inch, and could breathe through it for over five minutes without much discomfort, yet it represents in round numbers only the twenty-second part of the area or capacity of my trachea, estimating the diameter of the latter at seven-eighths of an inch. If we now construct a canula in the same ratio for a child of five years, the diameter of whose trachea is one-third of an inch, it gives a calibre of three-thirty-fourths of an inch in diameter, an opening about as large as the head of an ordinary sized pin. Trousseau's illustration, therefore, fails to sustain his argument in favor of larger tubes, as it is certain that canulas as small as this were never used. A more reasonable explanation of the return of the dyspnœa before the lapse of sufficient time for the extension of the disease, would be the entrance of blood, or the accumulation of secretions, because it occurred in only some cases, while if due to the inadequate size of the canula it should have occurred in all.

In my early experiments with intubation, the tubes had about the same calibre as those generally used for the trachea, but in order to avoid injury to the vocal cords, which I feared more than anything else, it was necessary to give them the oval or elliptical, instead of the cylindrical form. A few of these early forms I here show you. There was ample room, both in the glottis and trachea, for tubes of this size and shape. But I was not then aware of the hour-glass constriction that exists just below the vocal bands until it was demonstrated by the presence of ulceration through the whole thickness of the mucous membrane, corresponding to the long diameter, in every case in which the tube was retained for any considerable time. This defect could be remedied in only one or two ways, viz., either by diminishing the long diameter at the expense of the lumen of the tube, or by giving it the cylindrical form. The latter, by increasing the pressure on the vocal cords, would endanger their integrity, and I therefore adopted the former, and, as a result, the calibre of the tubes as at present constructed is probably less than half the original dimensions. The small calibre, consequently, was a matter of necessity, and not of choice, and if the larynx would tolerate no larger without injury, any further argument, as far as intubation is concerned, would

be useless. But from the fact that I have failed to find any ulceration at the points above indicated from the tubes as now made, I am satisfied that the cutting down process was carried further than necessary, and if demonstrated that a larger opening would give better results, this could be obtained without danger to the vocal cords by an increase of the transverse as well as the antero-posterior diameter. The bore of the smallest tube while still in the cylindrical form, which is intended for infants of one year and under, is exactly one-eighth of an inch in diameter. When we consider the size of the trachea at the same age, the disparity is not very great, and still less when compared with the subglottic division of the larynx, which is the narrowest portion of the breathing tube. This part of the larynx being completely surrounded by cartilage, is not subject to any variations in the normal condition, while the chink of the glottis may be greater or less, according to the position of the vocal cords.

I have found that in the adult the diameter of the lower division of the larynx is from one-eighth to three-sixteenths of an inch less than that of the trachea, which reduces the breathing capacity about one-third. I have not made any similar measurements in children, but by comparing a section from the cricoid cartilage placed beside one from the trachea, it does not appear that the area of the former is more than one-half that of the latter; in other words, the disparity is greater in children than in adults. In the preceding calculations I estimated on the size of the trachea, simply because it was more convenient, but it is evident that in order to arrive at correct conclusions, we must compare the lumen of the canula with that of the infraglottic division of the larynx, because the trachea would conduct air to and from the lungs just as well were it no larger than its mouth. But, as I have already stated, it was not from any such comparisons with the normal calibre of the larynx that the tubes have reached their present dimensions, but from noting the results of pressure on the intensely inflamed and infiltrated tissues as found post-mortem.

After an experience with tubes of various sizes in over two hundred cases of croup, besides other forms of stenosis of the larynx in children, I am fully convinced that, as at present constructed, they afford ample room for carrying on the respiratory function in the most perfect manner. When the disease is confined to the larynx and upper portion of the trachea, it is not an uncommon experience, after the paroxysm of coughing that immediately succeeds intubation has subsided, to find the little patient breathing so quietly and imperceptibly that it is sometimes difficult to convince the mother, who has returned to the room after an absence of fifteen or twenty minutes, that her child is still living. Such complete freedom of respiration would be impossible were the opening too small. When the struggle for breath has continued long enough to produce extreme exhaustion, together with more or less atelectasis and congestion of the lungs, this perfect relief does not occur. The same is true after the partial asphyxia induced by prolonged or repeated attempts to insert the tube. Such cases sometimes never rally, although air enters the lungs in the freest possible manner.

If any dyspnœa whatever remain for any considerable time after intubation, or if the respiration be much above the normal in frequency, it indicates the presence of some complication or extension of the disease below the tube. The fact that on several times removing a tube from the larynx I have found its calibre considerably reduced by firmly adherent secretions, when there had been no dyspnœa to indicate it, is good evidence that there is more room than is actually required for the free entrance and exit of air. Physiology teaches us that the muscular system is the great consumer of oxygen, and that when this system is at rest the consumption of oxygen is reduced to a minimum. It has been estimated that as much oxygen is consumed during one hour of active exercise as would suffice for four hours in a state of repose, with food, and for six hours without food. On purely physiological grounds, therefore, if only one-fourth or one-sixth of the amount of air is required in a state of rest, a canula bearing this proportion to the normal lumen of the air passages should afford ample room for the perfect performance of the respiratory function without the least effort whatever.

There would be no point in trying to determine through just how small a fraction of the normal lumen of the air-passages it is possible to carry on respiration effectually, if the only object to be accomplished by the artificial channel were to allow the free passage of air to and from the lungs. There would then be no room for argument, as there could be no objection to having the canula many times larger than necessary for this purpose, for such exists in the normal condition. I will add further, that were there no abnormal secretions to be gotten rid of, there would still be no reason for difference of opinion on this question. The only ground left for argument, therefore, is the manner in which the

machinery concerned in the removal of secretions is modified or injured by a canula in the larynx or trachea. The mechanism of coughing, as I understand it, is simply getting as much air into the lungs as possible, condensing it, and allowing it to escape suddenly, on the same principle as the air-gun. To accomplish this, the glottis is firmly closed, coincidently with spasmodic contraction of the expiratory muscles, until the imprisoned air is sufficiently compressed, not only to give it power to project any offending substance before it like the ball from an air-gun, but also to increase the friction between it and the lining membrane of the air-passages to such a degree as to scrape off, so to speak, secretions that may be adherent.

Considerable condensation, with great velocity of the expired air are, therefore, necessary to give the maximum expulsive power. The latter without the former would accomplish nothing, because the same volume of air can be driven through the open or half-open glottis just as rapidly as in the act of coughing, without the least power to remove a particle of mucus even from the larynx, much less from the bronchial tubes. This can be demonstrated by trying to cough while retaining the vocal cords in the expiratory position—the lack of power resulting solely from inability to compress the air to any appreciable extent. Coughing through a canula is identical with this act when performed with a partially open glottis, and the only means left of subjecting the air to any condensation whatever is the much shorter time occupied in expelling it through the same space by which it more slowly entered.

An excellent and forcible illustration of this argument, and one the mechanism of which is identical with that of coughing, is the familiar act of blowing the nose. There is little if any ability to remove secretions from this organ without first reducing the nostrils to a small fraction of their normal calibre, or by momentarily producing complete occlusion, as in closing the glottis, until the air is sufficiently condensed to force the secretions out with it. Very little power can be developed even by closing one nostril and forcing all the air through the other, if normally patulous. If secretions can be removed more effectually from the air-passages through a canula of the dimensions advocated by the authorities already quoted, for the same reason it should be easier to remove accumulations from the nose without compressing the nostrils. I claim, therefore, that while the artificial opening must be large enough for the perfect performance of the respiratory function, the power to expectorate is still further diminished, and in exact proportion to its increase beyond this limit.

MEDICAL SOCIETY OF THE COUNTY OF NEW YORK.

Stated Meeting, May 28, 1888.

The President, LAURENCE JOHNSON, M.D., in the chair.

The Sanitary Condition of the Croton River Water-Shed.

DR. JOHN C. PETERS made the report, which was verbal, and was for the purpose of inducing action on the part of the State Senate Investigating Committee to put an end to the nuisances existing on the Croton watershed, which were polluting the drinking water of the citizens of New York. Dr. Peters said the committee appointed by the County Society last year had been unable to get the city officials to take action in abating the nuisances, and there was now much greater necessity for it since the railways and land speculators were offering inducements to people to settle in the vicinity of the lakes from which the city got its water. About three years ago the population of the Croton watershed was twenty thousand; there were about nineteen hundred privies, six hundred barn yards, five cemeteries, several milk factories, over a thousand cattle and horses, etc., the sewage from which entered the Croton water. The comparative purity of the waters of Berlin, London, Boston and New York was estimated from the fact that the water of Berlin contained 99 bacteria to the cubic centimeter; that of London 44, and that of Boston 43, while that of New York contained 526. It was possible, through the sewage contamination taking place at the source of the Croton waters, for infection to occur at any day with the germs of typhoid fever, scarlet fever, etc. Indeed, the speaker suggested that it was not impossible that some of the numerous cases of scarlet fever and diphtheria which had for some time constantly prevailed in the city, had their origin in the Croton waters.

Acute Articular Rheumatism in the Nursing Infant.

DR. HENRY KOPLIK read a paper showing that the existence of acute articular rheumatism as an independent affection in the nursing infant is scarcely recognized by many writers. He gave the histories of two cases which had come under his own observation, one being that of an infant six months old, which had had pain, redness, and swelling in the feet and hands for five days before he saw

it. When he was called the temperature was 105.5° F., and the other symptoms were still present. On the eleventh day the rash of scarlet fever made its appearance. The tenderness of the affected joints subsided completely after eight weeks, and the recovery was complete. He thought the rheumatism and scarlet fever were, considering that the one preceded the other for so many days, quite independent of each other. The second case was that of a child nine months old, the feet and hands being affected, the temperature rising only to 102.5°. In neither case was there synovitis or cardiac complication. In the diagnosis Dr. Koplik excluded rheumatoid affections and obscure affections of the bones and joints, such as sometimes occurred in syphilis, rachitis, peri-articular abscess, osteomyelitis, etc.

The society then adjourned until the fourth Monday in September.

Hospital Notes.

THE HYGIENE OF THE BREASTS; TREATMENT OF PUERPERAL NIPPLE LESIONS, AND MAMMARY ENGORGEMENT, AT THE PHILADELPHIA LYING-IN CHARITY.

BY CHARLES P. NOBLE, M.D.,
SENIOR ASSISTANT PHYSICIAN.

Hygiene of the Breasts.

In view of the importance of the function which the breasts perform after child-birth, great care should be taken to have them in good condition for their work. A special indication for prophylactic care is the fact that an unhealthy state of the skin covering the nipples is a predisposing cause of nipple lesions during the puerperium. Many patients at this institution are unmarried primiparæ, and among this class diseases of the breast are most common. From motives of shame, many of them lace until their admission, compressing their breasts and nipples as well as their waists. Among hospital patients, habits of cleanliness are not very common, or their ablutions are limited to the face, neck, and hands. Hence, especial care on the part of the physician is necessary for these cases. In addition to the general baths which all waiting women receive, they are directed to wash the breasts with soap and water once or twice daily—on rising and retiring—taking care to remove collected secretions; also to apply a dilute spirit lotion, as cologne water, bay rum, or whiskey. There can be no question that cleanliness promotes the normal activity of the skin, or that alcoholic lotions, by slightly hardening the epidermis, tend to prevent maceration and erosions of the nipples in the beginning of lactation. The hardening process should not be carried too far, lest it destroy the suppleness of the skin, and thus defeat its object. When the nipples are more or less depressed, directions are given that they be gently elongated by traction with the thumb and fore-finger for a few minutes, twice daily. In these, and all other cases, the clothing is so arranged as neither to confine the breasts nor the abdomen. Where depression is marked, it not uncommonly happens that elongation is not secured by these measures. Nothing is then left but the use of the nipple shield during lactation, or it may be necessary in some cases to wean the infant. No reflex effects upon the womb have been observed.

Treatment of Puerperal Nipple Lesions.

Aside from ante-partum prophylaxis, much can be done in preventing these painful and really serious conditions. Sore nipples are usually caused by a constant moist condition, leading to maceration, exfoliation, and excoriation; or, by traumatism inflicted by the infant in suckling. When the infant is vigorous and the milk supply scanty, ecchymoses are apt to form on the crown of the nipple from the powerful suction, and when, as commonly happens, the epithelium subsequently exfoliates, an erosion or a fissure results. Hence, the nipples are carefully dried after each nursing, being first washed with a saturated boric acid solution, or a weak solution of borax. Also, until lactation is well established, it is not considered advisable to put the infant to the breast more frequently than once in four hours. Success in the treatment of sore nipples largely depends on beginning treatment early. For erosions, the compound tincture of benzoin is applied to the dried nipple with a camel's hair pencil—one or perhaps two coats after each nursing. Unless improvement follows in a few hours, Needham's nipple shield is used. (A practical point in the use of the shield is this: the nipple furnished is made of light rubber, and is somewhat stiff. If one of black rubber, such as are kept in the shops for nursing-bottles, be substituted, the child will have less difficulty in nursing, as the black rubber is softer and more pliable.) Nursing from the affected breast is allowed only at longer intervals. If true ulceration

is present, a solution of silver nitrate (ten grains to the fluid ounce) is applied, and nursing temporarily suspended. Cases of extensive ulceration have not been met with. For fissures, the solution of nitrate of silver is used, or the pointed, solid stick. The fissure may then be covered with collodion, or iodoform-collodion. But rest is what is required, and unless the remedies yield prompt results, nursing must be allowed only at longer intervals, or suspended for twelve or twenty-four hours. The shield does not give as much comfort in fissures of the base as in lesions of the summit of the nipple. A layer of cotton over the breast and a well-applied bandage is used to control milk secretion while rest is secured. All applications are washed from the nipple before the child is allowed to nurse. Cases of inflammation of the entire nipple structure have not occurred. All the cases at the Charity have yielded kindly to these measures. Mastitis has rarely followed, and in but one case has abscess resulted. The danger of infection by microbes should ever be borne in mind, and were greater care taken of nipple lesions mastitis would be a less common complication of the puerperal state.

Treatment of Mammary Engorgement.

While the occurrence of milk fever is no longer admitted, it is true that in certain puerperæ, symptoms are present about the third day which are caused by the establishment of lacteal secretion. In these cases the thermometer registers under 100° F., and usually does not exceed 99.4°. The pulse is but slightly if at all quickened. The patient is restless and perhaps thirsty. The breasts are swollen and somewhat painful, the pain perhaps extending into the axillæ. The condition is one of mammary engorgement, with constitutional irritation. The indications are to lessen milk secretion and hyperæmia of the breasts, and allay the constitutional symptoms. For this purpose the patient is put upon dry diet; is given a saline purge; full doses of sodium bromide, as much for its sedative effect as for its supposed action on secretion of milk; perhaps, also, the iodide of potassium. Locally, castor oil is used. It is smeared over the breasts (not rubbed or kneaded in, for such rubbing, stroking or kneading only increases hyperæmia and milk secretion, (*ubi irritatio, ibi fluxio*), and they are then covered with a piece of soft flannel or cotton wool. A bandage best relieves the sensation of dragging, and puts the breasts at rest. The "roller" is not necessary; besides it interferes with nursing and requires the woman to remove her clothing and sit up during its application. A modification of the bandage used in the Boston Lying-in-Hospital, described in Worcester's book on Nursing, has been employed. It is applied as follows: A bandage about six feet long and three inches wide is doubled, and reversed on itself in the centre—this forms a V. To the apex of the V, a strip of bandage is pinned, forming a Y. The leg of the Y is passed under the back, the apex of the original V being applied to the outer side of the left breast. The arms of the Y are then carried across the chest, one above, the other below the breasts, and brought together upon the outer side of the right breast. They are fastened together and to the leg of the Y (the strip which was passed under the back), by a single pin. These two pins control the bandage. These can easily be arranged so that the breasts are lifted toward the median line, and slightly compressed. The process is completed by passing a strip around the neck and fastening the ends to the bandage, first named, over the sternum; or a strip may be passed over each shoulder and fastened to the encircling bandage at the back and front. This elevates both breasts toward the shoulders. Added comfort is gained by laying cotton wool or a folded napkin over the breasts before the bandage is applied. After a little experience, it is easily and quickly done without disturbing the patient. By the removal of a pin, one breast may be exposed for nursing. Under this method of treatment, doubtless aided by the course of nature, the symptoms usually subside within twenty-four hours, and the patient in the meantime is made much more comfortable. In no case has mastitis resulted.

—At a meeting of the Academy of Sciences in Paris, April 30, 1888, M. Bimar announced the results of some investigations which he had made in regard to the distribution of the spermatic artery in man. The spermatic artery in man is distributed to the testicle only after division in the substance of the albuginea, and at the internal surface of this membrane. Its ramifications penetrate the substance of the testicle at different points on its surface and describe loops in its interior with their convexity directed toward the corpus Highmorianum, and from this smaller branches are distributed to the lobules. This mode of distribution is analogous to that seen in all mammals, especially in the ruminants.—*Gazette Hebdomadaire*, May 11, 1888.

Periscope.

Cancer of the Stomach Rupturing Externally.

Among some clinical observations published in the *Charité Annalen*, 1887, O. Fraentzel reports a case of cancer of the stomach, which ruptured externally. From this account it appears that in the pit of the stomach there was a distinct round tumor, which was soft to the touch and painful upon pressure. Somewhat to the right of the xyphoid process was a prominent spot which was tightly stretched and showed fluctuation. A needle was thrust into the fluctuating part of the tumor, and one and three-fourth ounces of a thick, cloudy fœtid fluid, mixed with air bubbles, were evacuated; the fluid was not of a distinctly foul odor, and it contained pus, fat and detritus. Subsequently under an anesthetic, the little fistula was divided, and entrance gained to a cavity the size of a small apple, which was filled with ichorous, foul smelling pus. Coughing expelled air which stank like carrion. At the autopsy a tumor the size of a hen's egg was found in the region of the pylorus. The interior of this tumor had broken down in suppuration, and in some places where the decay reached to the periphery of the tumor there was a direct communication with the abscess.—*Deutsche Medizinal-Zeitung*, April 16, 1888.

Penetrating Wounds of the Abdomen.

At the meeting of the Surgical Society of Paris, April 25, 1888, M. Le Fort made some remarks upon penetrating wounds of the abdomen. He thought it important to distinguish in such cases the point at which perforation occurred, for the prognosis varies very much according to the organs wounded. In illustration of the statement that wounds of the stomach are infinitely less grave than those of some other organs, he mentioned a case in which two butcher boys had been amusing themselves, after dinner, fencing with knives. One of the boys had his stomach perforated in such a way that the abdominal wound gave vent to some vegetables and meat which the injured boy had swallowed some moments before. The next day, and even during the four hours following, particles of food were discharged from the wound. Nevertheless recovery was perfect. M. Le Fort then went on to say that one of his students in a thesis upon this subject has collected eighty-eight cases of wounds of the stomach, of which number there were seventy-five recoveries. In fifty-two cases there was no surgical operation. In the twenty-three remaining cases, the interference was insignificant, except in a case of Larrey's in which the wounds in the stomach and abdomen were so large that a true laparotomy was done, followed by sutures. Le Fort thinks it is a mistake to say that the absence of peritonitis as a sequel to an abdominal wound is an indication that there actually is no perforation. Examples to the contrary, he says, are numerous and manifest.

From a series of ninety-five experiments made upon the cadaver, he concludes that wounds below the umbilicus are always perforating, and the frequency of perforation diminishes with the height of the seat of injury.

He agrees with M. Reclus that a distinction should be made between wounds made with pistol-balls, and those made with large projectiles. In the former case a plug of mucous membrane may possibly frequent extravasation. In wounds with balls of small calibre, refraining from operation should be the rule. Laparotomy should be done only when accidents arise, for it is an operation which is long, difficult and dangerous.—*Bulletin Médical*, April 29, 1888.

Acute Iodine Poisoning.

In the *Therapeutic Gazette*, April, 1888, Dr. W. O. Culpepper, of Barbadoes, reports the case of a colored boy 11 years old, upon whose leg two drachms of some preparation of iodine had been applied on Tuesday, January 17, about 9 P.M., for a skin affection. The application removed all the skin from above the knee to below the ankles upon both legs, leaving a raw surface as though it had been scalded. The same night, and on Wednesday, the child's suffering seemed to be local; but on Wednesday night he was seized with headache, pain in the back over the kidney, pain over stomach and bowels and bladder, and did not appear to have passed water. These symptoms became worse on Thursday, and there was also some diarrhœa and vomiting along with great thirst. The boy says he passed water once, the mother said that he tried several times but did not pass any.

On Thursday night the pains seemed to have reached their greatest intensity, and hiccough came on. The slightest movement induced vomiting and hiccough, and there was constant thirst and ineffectual attempts at urination. Constant spitting was stated to have been present at this time. On

Saturday morning Dr. Culpepper was sent for. He found the child vomiting, purging, hiccoughing, crying continually for water and bringing it up as soon as swallowed. No loss of consciousness, and no pain complained of except in the head and over the bladder. Temperature 98.8°, pulse rapid, but its force good. The skin was dry, and so were the tongue and buccal mucous membrane. The pupils seemed to be normal. The child complained of being giddy when his head was lifted, and he was said to have fainted away several times. The abdomen was flat, and there was no urine in the bladder; priapism existed. During Saturday he somewhat improved. Iodine was found in the feces. On the next day he grew worse; stools contained mucus and blood. His symptoms steadily became worse, the pains in the abdomen returned, but the intellect remained clear. He died at 4 A.M., Monday morning. His mother raised him to let him move his bowels, and soon after he passed away quietly and without pain; before death his stools were said to have become almost pure blood. His lungs were apparently unaffected.

State of the Gastric Juice in Febrile Diseases.

L. Gluzinski, in a communication to the *Deutsches Archiv für klin. Medicin*, Bd. XLI, endeavors to determine what change the function of the stomach undergoes during fever, and what the cause of the dyspepsia is. He examined fifteen patients with a view of deciding this question. The method of experimentation was to aspirate and test the contents of the stomach, after the administration of the white of one egg. The results obtained in typhus fever, pneumonia and typhoid fever, are as follows: 1. During the entire continuance of the fever, with the exception of the concluding stage of typhoid fever, the gastric juice contains no hydrochloric acid. 2. The juice has no digestive power, either in the organism or outside of it—contains no peptone. 3. After the addition of hydrochloric acid good artificial digestion is brought about, which shows that there was enough pepsin in it. 4. With the subsidence of the fever a gastric secretion having digestive power is furnished.

In chronic febrile diseases, such as phthisis and pleurisy, there was, however, a normal gastric juice during the fever. It seems, therefore, that under similar conditions the state of the gastric juice in febrile diseases is not so much influenced by the increased temperature as by the kind of infection.—*Deutsche med. Wochenschrift*, May 17, 1888.

Influence of the Bitters upon the Function of the Stomach.

N. Reichmann publishes a communication in the *Zeitschrift für klin. Medicin*, Bd. XIV, entitled an experimental investigation concerning the influence of the bitters on the function of the stomach in health and disease. His investigations were limited to the human stomach. In his tests he employed centaury, trifolium, gentian, quassia, and wormwood. Cold infusions (12 parts to 200) of these bitters were given without food, and before or during a test-meal of distilled water and albumen. The result showed that after the administration of these bitters, which all act alike, the secreting power of the stomach is less than after the taking of distilled water. But when the drug is eliminated from the stomach, the secretory apparatus is excited to increased activity. If food and the infusion were swallowed at the same time, both the secretory and the motor function of the stomach were impaired.

Of course the practical lesson to be learned from this is, that bitters should be used only in cases in which the gastric juice is diminished, and that they must be taken about half an hour before food.—*Deutsche med. Wochenschrift*, May 17, 1888.

Microörganisms of the Male Urethra and of Normal Urine.

Lustgarten and Mannaberg (*Vierteljahresschrift für Dermat. und Syph.*, vol. XIV, p. 905) removed, by means of a previously heated platinum spoon, portions of the secretion of the mucous membrane of the normal urethra. Among the great variety of bacterial forms found, there were two of special diagnostic interest. One was a bacillus morphologically identical with the bacillus tuberculosis, and the other a diplococcus in no wise distinguishable from the gonococcus of gonorrhœa. The bearing of this discovery upon the examination of urine for tubercle bacilli in cases of suspected tuberculosis of the genito-urinary organs is obvious. For such examinations they recommended catheterization with a sterilized catheter, since it was found by culture experiments that urine so obtained, not having passed through the urethra, was in most cases free from microörganisms.—*American Journal of the Medical Sciences*, April, 1888.

Fluctuation in the Amount of Hydrochloric Acid in the Stomach.

P. W. Burschinsky (*Wratsch.*, No. 47, 1887) experimented upon fourteen thoroughly healthy men in the following manner: About

nine o'clock in the morning they received tea with wheat bread, then about two o'clock in the afternoon the white of a hard-boiled hen's egg. One hour after the latter a sufficient quantity of the contents of the stomach was aspirated, and the estimation of the acid made. Then they had dinner, and about nine o'clock again had tea with wheat bread. About eleven o'clock they went to bed, were wakened about two o'clock and again received the white of egg. One hour later they were again wakened and the contents of the stomach aspirated. For the estimation of the free acid he employed Günzberg's reagent—an alcoholic solution of phloroglucine with vanilline, of whose utility he had previously convinced himself by numerous trials. His results are as follows: 1. The quantity of acid in the gastric juice is less at night than in the day. 2. The weakening of the acid reaction of the juice goes hand in hand with the weakening of the reaction for free hydrochloric acid. 3. Phloroglucine vanilline is an unusually accurate reagent for the free hydrochloric acid of the gastric juice.—*Deutsche med. Wochenschrift*, May 17, 1888.

Dry Mouth.

At the meeting of the Clinical Society of London, March 17, 1888, Dr. W. B. Haddon read a paper on dry mouth, or suppression of the salivary and buccal secretions. The patient was a woman, 65 years old, who had suffered from no affection which could throw light on her present condition. There was no history of family paralysis, or of the prolonged use of belladonna. Her mouth began to get dry some months previous to observation. The tongue was red, devoid of epithelium, cracked in all directions, like crocodile skin, and absolutely dry. The mouth generally was dry, and the mucous membrane smooth, shiny and pale, with a few patches of injection. There was also deficiency of moisture at the back of the pharynx. The tonsils were natural. The salivary glands, as far as could be made out, were natural in size. Common sensation of the inside of the mouth was unimpaired; but the sense of taste was retarded in consequence of the deficiency of moisture. When the mouth became moist later on, the saliva was found to be slightly acid, and to exert no action on a solution of starch. During this time the mouth had been getting dry, perspiration had notably diminished, and the lachrymal secretion was arrested. The patient received much benefit from the use of jaborandi. A case of similar nature under the care of Mr. Hutchinson was alluded to, and one under the care of Dr. Rowlands, of Liverpool, was communicated by the author of the paper. In conclusion, it was suggested that this condition of dry mouth was due to some disorder of the nervous apparatus. — *Lancet*, March 17, 1888.

Treatment of Varices by Ligature of the Internal Saphenous Vein.

After a brief review of the results obtained by Schee, Annandale, Madelung, Langenbeck, Fry and others, in extirpating varices, M. Ed. Schwartz details (*Rev. gén. de Clin. et de Ther.*, February 2, 1888), three cases in which he tied the saphenous vein at two or three different places, dividing it between ligatures, the indications being in one case a very painful varicose swelling at the inner border of the knee; in another, an extensive ulcer; in the third, great varicose enlargement of the leg. In the one just mentioned, the venous tumor, having become hard and firm from thrombosis, was enucleated three days after the ligation of the vein. Eight months later there was no serious return of trouble. The ulcer, which was two by two and a-half inches in size, and had persisted for six months, resisting other treatment, healed in eight days. Five months after operation, the cure remained complete. The third case did not report for observation, but the immediate result was a complete cure.

M. Schwartz believes with Langenbeck that these cases, as in the operative treatment of hernia, a long time must elapse before a radical cure can be claimed, but thinks it safe to say that the multiple antiseptic ligature of varices, and even their extirpation, when they form painful tumors, is strongly indicated, especially when the means usually adopted have proved ineffective and the patients are not much beyond middle age.—*American Journal of Medical Sciences*, April, 1888.

Instantaneous Cold.

The *Phar. Centralblatt*, 1887, p. 532, says that under this name a convenient substitute for outward application of ice is made by Boschlin, of Montpellier. It consists of felting made from cotton, jute, cotton-waste or China-grass, saturated with a mixture of several salts (nitrate of ammonium, chloride of ammonium, nitrate of potassium and sulphate of sodium) which upon being wet with water produces a low temperature.—*American Journal of Pharmacy*, April, 1888.

THE

Medical and Surgical Reporter.

A WEEKLY JOURNAL,

ISSUED EVERY SATURDAY.

CHARLES W. DULLES, M. D., EDITOR.

The Terms of Subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	**$5.00**
Quarterly Compendium of Med. Science,	**2.50**
Reporter and Compendium,	**6.00**
Physician's Daily Pocket Record,	**1.25**
Reporter and Pocket Record,	**6.00**
Reporter, Compendium and Pocket Record,	**7.00**

All letters should be addressed, and all checks and postal orders drawn to order of

Drs. RANDOLPH & DULLES,

N. E. Cor. 13th and Walnut Streets.

P. O. Box, 843. Philadelphia, Pa.

THE DISEASE OF THE EMPEROR OF GERMANY.

After many vicissitudes of belief and statement it seems at last to be decided that the disease of the former Crown Prince, and late Emperor of Germany, was cancer of the larynx. This furnishes a sad confirmation of the opinion which we have always expressed in the REPORTER as to the nature of this malady, which has given rise, for the past year, to so much discussion. It is now asserted, or intimated, that Sir Morell Mackenzie has all along known that his patient had cancer of the larynx, and that he played the part of a wise and good man in concealing this fact from the world. This may be so; but the supposition would place in an unenviable light the man who could put to shame the best surgeons of Germany with a lie, and could treat so treacherously the enterprising medical journals in this and other countries which paid for his personal reports of the case, and confidently accepted and adopted his assurances that there was no sufficient evidence that the disease was cancer.

The dilemma between this and an error of diagnosis is an awkward and unfortunate one, indeed, and we cannot see much to choose between its two horns. Meanwhile, we feel as strongly as we have always felt that the straightforward course is generally the best one; and we shall feel this still more strongly, if it turns out—as it has been intimated that it may—that concealment of the nature of the Crown Prince's malady led to his mounting the Imperial Throne without authority of law, and involves the validity of every act he performed as Emperor.

RHEUMATIC PNEUMONIA.

In the *Lancet*, May 5, 1888, DR. W. B. CHEADLE has an interesting account of an outbreak of rheumatic pneumonia which occurred in St. Mary's Hospital, London. We gather from his paper that there was a series of six cases, four of which occurred in June and July, 1887, and the others soon afterwards, and that the symptoms were so similar in all the cases as to deserve special notice. In the first place, in every case except one the pneumonia followed an attack of pericarditis, which was itself a complication occurring in the course of the inflammatory rheumatism. In one patient, it is true, no pericarditis was noted; but, Dr. Cheadle very justly says: as the patient had twice before had attacks of rheumatic fever, the pericardium might have become adherent, and so no friction sounds have been produced; or the pericarditis may have existed before and been undetected. The patient died with double pneumonia, but unfortunately no autopsy could be obtained. Now, in the five cases in which the pneumonia followed an attack of pericarditis, it came on after a definite interval. This interval was, in two cases, six, and in two others, seven days after the first sign of pericarditis. In the remaining case the pericarditis existed fully developed at the time of the patient's admission, and the pneumonia appeared two days later, so that in all probability the length of the interval between the two complications was very near that known to have occurred in the others. It may be noted in passing, that in all of the six cases there was valvular disease of the heart; in four cases it was of long standing and of great gravity, while in the remaining two cases mitral regurgitation developed during the attack of rheumatism.

Not only was the time of appearance of the pneumonia peculiar, but it differed from ordinary pneumonia in its location and in its chief physical signs and symptoms. For example, it is well known that ordinary pneumonia is more common upon the right side than upon the left; but in the outbreak under discussion it invariably appeared first in, and chiefly affected, the lower lobe of the left lung. In three of the cases the right lung became similarly affected, but at a later date. Again, both cough and expectoration were entirely wanting. The pneumonia seemed to be fully formed when first discovered; even the crepitant râle of the initial stage was wanting in one case. It was recognized by the usual physical signs—dulness, blowing breathing, and increased vocal fremitus. Finally, the pneumonia which occurred in these cases differed from ordinary pneumonia in ending by lysis, not by crisis.

As these cases of rheumatic pneumonia occurred in patients who were in the hospital, and could therefore be closely observed, the cause to which Dr. Cheadle attributes the outbreak is entitled to much consideration. It is simply this: that the free ventilation in the wards of the hospital, made almost necessary by the extremely hot weather, had been sufficient to chill these rheumatic patients, who, as is well known, are peculiarly susceptible to cold. While it may be granted that draughts of air may have been the immediate occasion of the attacks of pneumonia, it is not too much to say that a predisposing cause of them may be recognized in the changed condition of the patient, a condition produced by the effect of the rheumatic poison on the blood. It is a significant fact that the pneumonia should have occurred in every case first on the left side; it is not improbable that the pleura became affected first by extension of inflammation from the pericardium, and that the inflammation of the lung tissue followed that of the pleura. In many of the cases which have been reported by other observers, there has been rather severe congestion, with undoubted apoplexy in some of the cases, as proved by the autopsy, than true pneumonic consolidation. But the cases here mentioned seem to have been true pneumonia, the cause of which, as we have already intimated, may have been the same as the cause of the rheumatism.

SACCHARINE.

This interesting chemical product, which attracted so much attention when its properties were first announced, has been the subject of continued investigation in order to determine whether or not it has any therapeutic value. The result of these investigations seems to indicate that it is to be regarded as a condiment rather than as a medicament.

An elaborate paper in the *Gazette Hebdomadaire*, May 18, 1888, by M. Charles Eloy, traces its history from the year 1879, when it was first isolated by Fahlberg, of New York, to the present time, and shows its physiological properties to be almost *nil*. It does not appear to modify any of the functions of animals to which it is administered, and it escapes from the body in the urine without interferring with any of its normal constituents. It, however, has a tendency to prevent fermentation, and to delay the metamorphosis of starch into glucose by the action of ptyaline or of pancreatine. Urine and feces containing saccharine do not ferment or become putrid as rapidly as those which are without it.

The hope that saccharine would prove of value in the management of *diabetes mellitus* has not yet been confirmed by experience; for in a number of cases it has soon excited disgust or given rise to symptoms of dyspepsia. It seems also, at times, to cause purgation. For this reason, saccharine must be used with discretion in cases of diabetes, and its use must be discontinued if it gives rise to gastric disturbance. If indigestion is a marked feature of diabetes, the use of saccharine seems to be absolutely contra-indicated.

In regard to its antiseptic properties, nothing of importance is yet decided. The natural hope that an antiseptic which is so largely eliminated from the body by the kidneys would prove of value in the treatment of cystitis, has not come to fruition as yet; and in no other respect has saccharine been shown to be superior to other and better

known antiseptics. As an addition to distasteful medicines the results obtained have also been disappointing; and there is some reason to fear that when added to sour wines, to sweeten them, it is to be regarded as an adulteration.

These conclusions in regard to saccharine need not be regarded as final; for further observation may reveal new ways in which it may be used in commerce or in medicine; but as yet it cannot be said to have won a very high position in either of these fields.

THE MANAGEMENT OF HOSPITALS FOR THE INSANE.

We alluded briefly, in our issue for June 9, to the action of the Pennsylvania Medical Society on the resolution of Dr. Hiram Corson to urge the State Legislature to separate the administrative control of the State Hospitals for the Insane from their medical management. This action seemed to be prompted by a feeling that a sort of of personal attack was intended upon the medical superintendents of three of the State Hospitals, and a desire to avoid the appearance of sanctioning such an attack. That no such personal attack was contemplated seems to be clear from the expressions of Dr. Corson and of those who share his opinions in regard to the principles involved in his resolution; but the medical superintendents who would be affected by its passage opposed it, because its animus might easily be misunderstood, and also because they do not share Dr. Corson's opinions in regard to the way in which hospitals for the insane should be managed.

After this resolution was disposed of, and at a subsequent meeting of the Society, another, of a thoroughly prudent character, was introduced by Dr. E. A. Wood, of Pittsburgh, calling for the appointment of a committee of thirteen, to include the medical superintendents of all the State Hospitals for the Insane, to investigate the question raised by Dr. Corson and to report to the Society. The resolution was adopted unanimously, and it is to be hoped that it will bring about a satisfactory solution of a very important question. Those who would regret to see any reflections cast upon the superintendents of the Warren, Danville and Harrisburg hospitals cannot but acknowledge that the question of separating the medical from the administrative functions of their superior officers is one which demands careful consideration, and that it ought to be decided without favor as well as without prejudice.

We have no doubt that the work of the committee representing the Pennsylvania Medical Society will go a great way toward determining this matter, and we expect that it will be of great service to the Legislature when they are next called upon to fix the slates of the medical officers of State hospitals for the insane.

ANTIPYRINE AND SEA-SICKNESS.

Not long ago there was an animated discussion at the Academy of Medicine of Paris introduced by a communication of M. Ossian Bonnet, who maintained that antipyrine was the best remedy for sea-sickness. A few days later M. Aubert suggested that the departure of the French delegates to the French Association for the Advancement of Science, to be held at Oran, Algeria, would be a very good occasion upon which to try the efficacy of the drug. We now learn from the *Bulletin Médical*, May 20, 1888, that M. Etienne Rollet, one of the Lyon internes, went with the delegates to Oran, and, not being attacked with sea-sickness himself, was able to study carefully what took place among his companions. It is amusing to learn that the passengers, who repaired in large numbers to the Congress, set sail at four o'clock in the afternoon, and at six o'clock, when at least sixty had taken antipyrine, only four remained at table to finish their dinner! This was as true of those who took the antipyrine two or three days before embarking, as of those who deferred taking it until their arrival on board the vessel. On the return from Oran, M. Rollet was able to prove that antipyrine has no action upon sea-sickness. As an impartial observer he concluded that antipyrine could not be counted on, when administered by the stomach in the usual

doses, either as a means of treatment during the attack or as a preventive of sea-sickness.

If M. Rollet's opinion is confirmed by subsequent observers, no more can be said than that antipyrine has failed where almost every drug in the pharmacopœia had been tried and found ineffectual. We may still hope that antipyrine will prove useful in some cases in which other drugs have failed, and come to be counted as one of the drugs which may with propriety be tried in the treatment of sea-sickness. The susceptiblity of different persons to this disorder varies so widely, and the reasons for this variation are so little understood, that it is not to be expected that any one drug will be be found equally serviceable in all cases.

NEPHRECTOMY.

The papers and discussions at the recent meeting of the Pennsylvania State Medical Society on the subject of nephrectomy were of the greatest interest and value. The paper of Dr. John B. Deaver, published in the last number of the REPORTER, lays down clearly the indications for this operation in cases in which the kidney is the seat of morbid growths, and the demonstration, by Dr. Mordecai Price, of a case in which he successfully removed the right kidney for a pistol-shot wound passing through the liver and into it, was a most striking proof of what can be accomplished by courageous and discreet surgery.

An operation which has now been performed more than four hundred times cannot be said to be any longer on trial; and it seems to be clear that the successful performance of it may be regarded as a question of skill in diagnosis and dexterity in practice.

Fortunately for surgeons and for mankind, the matter of diagnosis is not usually obscure in cases of penetrating wounds of the abdomen, and a laparotomy, if properly executed, is a certain and far from dangerous means of clearing it up. In regard to morbid growths, a careful study of Dr. Deaver's paper will show that a diagnosis of their seat and nature—so far as the kidneys are concerned—is not so difficult as one might suppose, and the question as to the propriety of nephrectomy is not hard to decide. There may be surgeons who would operate more freely than Dr. Deaver advises, but we think it may be said to be quite safe to follow the rule which he has laid down.

WASHING OUT THE STOMACH AFTER OPERATIONS UPON THE MOUTH.

At the recent meeting of the Pennsylvania Medical Society, Dr. Goodwillie, of New York, made, by invitation, some very interesting remarks in regard to his mode of operating for the cure of hare-lip. In the course of these remarks he stated that it is his custom to wash the stomach out after operating, in order to empty it of the blood which often enters it during operations of this kind. This procedure, as he described it, is simple and easy to execute, and not only frees the stomach of a useless burden, but very materially lessens the probability that vomiting will occur. As vomiting after operations upon the mouth is a very disagreeable occurrence, and endangers the success of what has been attempted, it must be regarded as a decided advantage to prevent it, and the method used by Dr. Goodwillie deserves the careful consideration of all surgeons.

SMOKERS' VERTIGO.

At a meeting of the *Academie de Médicine*, May 15, 1888, M. Lagneau read a report upon a communication made a month before by Dr. Decaisne upon the vertigo observed in smokers. While confirming the general opinion that excessive smoking may give rise to vertigo attributable to tobacco, M. Lagneau called attention to the fact that vertigo due to congestion of the brain may be confused with tobacco vertigo, if it occurs in the person of a smoker.

As most medical men are addicted to smoking, it may give them some comfort to think, when their heads swim, that this is not caused by their indulgence, but chargeable to over work. Still, if they overwork themselves at the right end of a pipe or cigar, we would suggest that a little rest at this point might relieve the congestion which annoys them. This sort of rest-cure is worthy of a trial.

Book Reviews.

[Any book reviewed in these columns may be obtained, upon receipt of price, from the office of the Reporter.]

DISSOLUTION AND EVOLUTION, AND THE SCIENCE OF MEDICINE, Etc. By C. Pitfield Mitchell, member of the Royal College of Surgeons, England, etc. 8vo, pp. xiv, 246. London: Longmans, Green & Co., 1888. Price, Sixteen shillings.

This book contains an attempt to disseminate some new applications of Mr. Herbert Spencer's leading generalizations, especially as applied to the study of pathology. The style of the book may be inferred from the opening sentence: "Dissolution is a disintegration of matter and concomitant absorption of motion, during which the matter passes from a definite coherent heterogeneity to an indefinite, incoherent homogeneity, and during which the retained motion undergoes a parallel transformation."

The following study is of the most abstruse and perplexing character, and while it may attract a few men familiar with the terms and style of Mr. Spencer's works, we doubt that many of our readers will care to go quite through it. The argument leads up to certain so-called "practical deductions and conclusions." These, we regret to say, strike us as lame and impotent, and we lay the book aside with a sense of regret that so much energy should have been spent in preparing a treatise which must confuse, if it does not confound, those who look to it for light. The publishers' part in making this book has been very well done, but we can hardly forgive them for bringing it out without an index.

Pamphlet Notices.

[Any Reader of the Reporter who desires a copy of a pamphlet noticed in these columns will doubtless secure it by addressing the author with a request *stating where the notice was seen* and enclosing a postage stamp.]

State Protection Against Quackery. By Charles F. J. Lehlbach, M. D. The President's Address at the 72d Annual Meeting of the Essex District Medical Society, held at Newark, N. J., April 3, 1888. 19 pp.

Report of Proceedings of the Illinois State Board of Health. Quarterly Meeting. Chicago, April 19–20, 1888. 13 pp.

Migraine in Childhood. By Wharton Sinkler, M. D. From the Transactions of the Philadelphia County Medical Society, October 12. 1887. 8 pp.

The Legal Aspect of Suicide. Annual address before the Medical Judisprudence Society of Philadelphia, January 10, 1888. By Hon. Wm. N. Ashman, President of the Society. Published by the Society. 6 pp.

—Dr. Lehlbach's address is most attractively written, and describes the unsatisfactory conditions of medical practice in New Jersey, where any sort of a diploma carries with it the right to practice. Dr. Lehlbach very truly says that it is a mistake for the community to demand that medical men shall carry out some scheme to protect it from the dangers of quackery; and puts the responsibility where it belongs, namely: on the State. Still, like other public spirited physicians all over the land, he urges a plan which ought to require no urging from doctors, and gives his voice in favor of the establishment of a State Board of Examiners.

—One of the most interesting subjects considered in the report of the Illinois Board of Health—which is an excellent bulletin of its proceedings, strictly scientific and unpretentious—concerns the "Wear and Tear of the Medical Profession." Studying the facts in regard to about 14,000 physicians in Illinois, Dr. Rauch makes the annual death rate for ten years just passed to be about 13.3 per 1000. The annual death rate among physicians, for the first few years after entering practice, is lower than that for all males living in the State; between the ages of 40 and 60 years it is higher; and after this it becomes progressively lower up to the age of 80 years, after which it is enormously higher. The inferences to be drawn from the table presented in this report are exceedingly interesting, one of them being that a very large number of physicians must live longer than 80 years.

—Dr. Sinkler calls attention to the frequent occurrence, and the importance, of migraine in childhood. He points out the influence of heredity in producing it, and of poor food and air, loss of sleep and eye-strain in provoking it. The treatment suggested is indicated partly by its cause, and consists in securing good nutrition with as sparing a use of medicine as possible.

—Judge Ashman's address on suicide is of the most interesting and instructive character. It defines the legal view of suicide as it could be defined only by one learned in the law and skilled in saying what he means. It contains some very curious statements as to the way in which the law regards and treats those who succeed in the act of suicide or fail in the attempt, as well as those who prompt or aid it. The relation of insanity to attempts at suicide is briefly alluded to; and the author goes further than Prof. Reese, who denies that suicide is an evidence of sanity; for Judge Ashman thinks it is sometimes an evidence of unusually cool and deliberate reasoning. For the other interesting matter of this address, we must refer our readers to the pamphlet itself, which we promise them will amply repay them for the effort to secure a copy.

—Dr. Semeleder, of Mexico, writes to the *Medical Record*, April 7, 1888: "A man, forty-five years old, suffering from pneumonia, was treated by the dosimetric method, the following being one of his prescriptions, the figures representing granules to be taken at a dose. Bromocamphor, 8; quinine hydrobromate, 4; arbutine, 1; strychnine hypophosphate, 1; aconite, 1; veratrine, 1; digitaline, 1; sodium benzoate, 1; iodoform, 1; helenine, 1; musk 1. These were to be taken once in every two hours, that is to say, a new medicine every ten minutes. In addition, two granules of quassine were given every time the patient took any nourishment. He took an average of three hundred granules a day, or three thousand in the course of ten days; when he died. The cost of medication for this period was $45."

Correspondence.

Veratrum Viride.

Editor Med. and Surg. Reporter:

Sir:—I am constrained to believe, from experience, that the profession have not entirely given veratrum viride its broadest position in the field of therapeutics. In acute pneumonia, a disease in which it is used most, I am inclined to think that its seemingly good effect of toning down the pulse, acts only as a mask for the subsequent heart failure induced by its administration. Indeed, I have been induced to believe that this drug is of little avail in any acute inflammatory affection. But it is in chronic blood diseases where veratrum viride wields its most beneficent influence as a remedy. Among these, syphilis offers a broad field for its action. If the disease is in its incipiency I usually give hyd. chlor. mite in one or two grain doses for about a week, and then stop it. I next order the patient to take Norwood's tincture veratrum viride, five drops ter die, immediately after eating, in water, for one week, when the night dose is increased one drop every night until the dose of ten drops is reached. I then keep the patient taking five drops after breakfast and dinner, and ten drops after supper, until the disease is expelled from the system. As adjuvants in the treatment I order the bowels to be kept open with saline aperients, the skin to be kept acting by a daily bath, and if there are chancres I either use iodoform liniment or calomel and iodoform powders in equal parts, applied three times per day. The use of alcoholic stimulants is strictly interdicted. In scrofulosis the drug is equally as efficacious. The treatment is about the same as in syphilis, except that there is no mercury used, and a good emulsion of cod-liver oil is employed and given with the veratrum. All glandular enlargements in scrofula, and buboes in syphilis are rapidly absorbed, and syphilitic laryngitis quickly relieved by veratrum. Syphilitic ophthalmia also shows its virtues by the rapid reduction and extinction of all inflammatory action, so soon as the system gets well under the alterative influence of the remedy.

The efficacy of veratrum in puerperal fever has, in recent years, been brought to the notice of the profession. I will add here, however, that the reflex influence upon the brain, and the detergent effect upon the circulatory system, of croton oil, administered in two drop doses until the bowels respond well to its action, greatly assists veratrum in controlling puerperal convulsions.

Yours truly, A. H. Byrd, M.D.

Burton's Hill, Ala., June 4, 1888.

Treatment of Wounds of the Palmar Arch.

Editor Med. and Surg. Reporter:

Sir:—Your editorial of June 2 recalls a case of mine in the summer of 1886. A young man came to my office with his hand wrapped in cloth soaked in blood, and from which the hemorrhage still continued very profusely. Upon taking off the bandages, I found a wound in the palm two inches in length extending entirely through all the tissues to the metacarpal bones, and from which the divided ends of three tendons protruded. I was unable to ligate the bleeding vessels, and after a discouragingly painful effort to stop the hemorrhage in that way, I soaked cotton in solution of alum, pressed it directly into the gaping wound, and securely binding it on, slung the arm up, and left it. I was very anxious about the results, as I had never seen anything of the kind recommended. The wound progressed very favorably; nothing occurred to prevent an excellent union of all parts. Should I have another case in which torn arteries in the palm of the hand could not be *easily* reached, I shall again use compression, as I deem it less painful and conducive to as good results as ligation in the palm, and while not as favorable for an exhibition of surgical implements and surgical skill (as regards cutting), as the wrist operation, it helps much to establish conservative surgery, from which the desire to cut naturally tends. Yours,

H. L. Manchester, M.D.

Pawlett, Vt.,
June 6, 1888.

Blue Gum Negroes.

Editor Med. and Surg. Reporter:

Sir:—About two years ago, in the vicinity of Como, Miss., Mr. Douglas Durrett became involved in a difficulty with a *blue gum* negro, by whom he was bitten upon the hand. Inflammation and suppuration of the hand and arm ensued, from the effects of which he died in about ten days; the poisonous nature of the wound being attributed to the peculiar color of the the negro's gums. Others of the neighborhood were reminded of a similar instance which had come within their observation. And about May 1, near Victoria, Miss., Mr. William Cannon, while engaged in a fight with a *blue gum* negro, was bitten on the hand, and came near losing his life. The

newspaper in writing up the occurrence, stated that one of the medical attendants had never "heard of such a thing;" and another had only heard of two cases up North—reported, I suppose, by the Northern press.

Unable to recall any allusion in medical literature to the fact that the bite of persons possessing blue gums (no race, save the negro, has) is peculiarly poisonous, I write for light on the subject; and shall be glad to hear from you, or any other member of the profession. There being a *shadow* of foundation for such a belief, if by investigation the fact can be established beyond question, why should not our legislatures make the biting of another by an individual having *blue gums* something more of an offense than a mere *assault?*

Yours truly, A. A. YOUNG, M.D.
Clear Water Harbor, Fla.,
May 31, 1888.

Brother Come's Caustic Balsam.

EDITOR MED. AND SURG. REPORTER:

Sir:—Will the Editor, or some one of its contributors, give to the readers of the REPORTER, the receipt for Come Bros. Caustic Balm mentioned on page 538, April 28, 1888, and oblige.

Yours truly, SUBSCRIBER.
Wysox, Pa.
May 15, 1888.

EDITOR MED. AND SURG. REPORTER:

Sir:—In reply to yours of May 17, the following is the formula for Brother Come's caustic balsam, and the manner of using it:

℞ Arsenic. alb. (white arsenic)....1 gramme
Hydrarg. sulphuret. rubrum .....5 grammes
Spongia usta (calcinated sponge) 2 grammes
M.—Pulverize.

At the time of using it, water is added to this powder until it has the consistence of cream; it is then lightly applied with a brush on the ulcerated surfaces, taking care to use only a small quantity. It is better to apply it at different times at several days' interval, than to apply a great deal of it at once.

It is then covered with a piece of adhesive plaster, and kept in place until the eschar drops away, which occurs from the 10th to the 30th day.

If the ulcerated surface is very large, the treatment must be divided; not more than three square centimeters must be treated at once, on account of the danger of absorption; and a new portion must be cauterized only when the preceding eschar has fallen off.

If at the periphery of the ulcer there are dried tissues, these must be refreshened, for the caustic will act only on fresh or wet tissues.

Yours truly,
ARTHUR C. HUGENSCHMIDT, M.D.
Paris, France,
May 29, 1888.

NOTES AND COMMENTS.

Insoluble Pencils for the Urethra.

The *Monatshefte für prakt. Dermatologie* No. 5, 1888, states that in ulcerations and inflammations situated in the anterior portion of the urethra, or at the meatus, in which healing is rendered extremely difficult through the contact of the diseased parts with urine and the reinfection thus brought about, antiseptic pencils are of great service. Formulæ hitherto employed result in the common fault that the pencils are too brittle, can be moulded only with difficulty, and dissolve too quickly at the temperature of the body. The following formula is recommended:

℞ Olei theobromæ..... gr. xc
Ceræ albæ.....gr. lxxv
Acidi borici (*vel* iodoformi)....gr. xxx
Zinci oxidi.....gr. xv
Tragacanthæ. .....gr. lx
M. ft. bacilli elastici.

These pencils can be made of any desired length or thickness, and for ease of introduction of a conical form. They keep the walls of the urethra separated, for they do not disappear for hours. They should not be used when, as in obstinate catarrh of the bladder, a powerful stream of urine is necessary to expel them.—*Allgemeine med. Central-Zeitung*, March 14, 1888.

Menstrual Bleeding from a Laparotomy Scar.

At a recent meeting of the Kiev Obstetrical and Gynecological Society, Professor Georg E. Rein showed (*Vratch*, No. 7, 1888, p. 136), a menstruating woman from whom he had about three years before removed a cyst of the right ovary weighing thirty-seven pounds, fixing the pedicle in the abdominal wound. The patient soon recovered, and the wound healed, but at one part of the scar there remained a diminutive slough, which fell off just before the beginning of menstruation, its separation being followed by a constant flow of blood from the denuded surface during the whole catamenial period. The phenomenon had regularly recurred monthly ever since. As a rule, the scar begins to bleed somewhat earlier than the uterine flow makes its appearance. The

menstrual blood from the cicatrix has a characteristic odor. It is difficult to explain such an occurrence. Possibly a Fallopian tube or one of the uterine cornua had been stitched together with the pedicle into the abdominal wound. However, Professor Rein hopes soon to ascertain the nature of this interesting and rare case, since the patient must undergo a second laparotomy for disease of the left ovary.—*British Med. Journal,* March 31, 1888.

Suggestion as to the Cure of Goitre.

French army surgeons have been profitably employed in drawing up medico-geographical reports of the French Departments. Surgeon-Major Aubert has already reported to the Académie de Médecine on Calvados, Loire-Inférieure, and La Vendée. On February 14, his report on the Medical Geography of the Ain was read. In reference to ninety-three men with goitre from the mountainous districts of that department, who were exempted from military service from 1872 to 1886, Dr. Aubert makes a most reasonable suggestion. As most cases of goitre between the ages of 18 and 20 are curable, a great service would be done to them by enrolling, instead of rejecting them, and placing them in the territorial army in healthier parts of France, particularly in coast stations. By sending these men far from their mountains to naval arsenals they might be permanently cured, and at least could not fail to derive great benefit from the change. —*British Medical Journal,* March 31, 1888.

Aromatic Vinegar.

The *American Druggist* gives the following as Dieterich's formula:

Tincture of benzoin	1 fl. oz.
Alcohol	1⅛ " "
Acetic Ether	1½ " "
Extract of jasmin	1½ " "
Acetic acid	3½ " "
Oil of rose	10 drops
Oil of Neroli	5 "
Oil of wintergreen	5 "

The Microbe of Infectious Endocarditis.

The *Gazette Hebdomadaire,* April 13, 1888, states that at a recent meeting of the *Société de Biologie* of Paris, M. Gibert announced that he had, in conjunction with M. Lion, cultivated a microbe found in a patient who had died of infectious endocarditis. The blood and the vegetation in the heart yielded the same microbe and only this one. When this was inoculated in rabbits it produced vegetative endocarditis without there having been previous valvular lesion.

Hydrophobia at Rio Janeiro.

A Pasteur Institute has been founded in the capitol of Brazil. In the reception-room for patients, there is hung a splendid photograph of Edelsfeldt's large picture, exhibited in Paris at the Salon, in 1886. It represents Pasteur in his laboratory, observing an inoculated marrow in a bottle. The Institute was inaugurated with great solemnity in the presence of the Ministers and most of the medical corps of Rio.

Novel Extension of the Uses of Cocaine.

Under this title Mr. E. Hurry Fenwick, in a communication to the *Lancet,* May 5, 1888, relates some remarkable experiences in the use of injections into the urethra of strong solutions of cocaine, for the purpose of relieving subacute pains remote in situation from the urethra. After citing several cases in which there was pain of a neuralgic or muscular character, he concludes that if pain in any part of the body be due to a *slight* nerve irritation of an unimportant character, a cocaine injection will rapidly relieve it; whereas, if the pain is due to a severe nerve irritation, a cocaine injection will not relieve it. He has applied cocaine in this way for the determination of the presence of organic or functional disease of the kidney, and has several times been able to verify his diagnosis through the patient's subsequently passing a small stone. He employs a 20 per cent. solution in water, and injects twenty or thirty drops.

Creasote in Chronic Affections of the Lungs in Children.

In the fiftieth report of the Wilhelm-Augusta Hospital at Breslau, Prof. Soltmann communicates the results of the treatment of chronic lung affections of children with creasote. He employed it in cases in which there were slight or progressive disturbances, without regard to the presence or absence of bacilli. The creasote was given to children in doses of from two to seven drops a day, while to adults, three, six or ten drops were ordered. His prescription is as follows:

Creosoti	gtt. iv–xiv
Sp. ætheris	gtt. vi–xij
Aquæ destill.	f℥iss
Sacch. albæ	gr. cl

M. Sig.—Teaspoonful every two hours.

The creasote was admirably borne without exception by all the children, and taken without resistance. Pain in the stomach, nausea, vomiting and diarrhœa never occurred, even when there was high fever. It is

noteworthy that in almost all cases the appetite increased, that the patients gained in weight with striking rapidity, their appearance became blooming, the cough and expectoration diminished, and gradually the symptoms of disease of the lungs disappeared.—*Wiener med. Presse*, April 22, 1888.

Influence of Salt upon the Secretion of the Stomach.

N. Reichmann publishes a communication in *Archiv für exper. Pathol. und Phar.*, Bd. XXIV, upon an experimental investigation concerning the local influence of salt upon the secretion of the stomach. By giving it when the stomach was empty, and before and after a test meal, he was able to determine that so far from increasing the secretion of gastric juice, it actually hinders it. The diminution of the acidity of the gastric juice, as was always proved after the introduction of sodium chloride, arises chiefly through transudation from the vessels of the mucous membrane, which is irritated by the salt; but the transudate is alkaline and neutralizes the hydrochloric acid.—*Deutsche med. Wochenschrift*, May 17, 1888.

Sulphonal.

In the *Berliner klin. Wochenschrift*, April 23, 1888, Rabbas communicates the results of his trials of sulphonal in the clinic for mental and nervous diseases at Marburg. He used the drug two hundred and twenty times upon a total of twenty-seven patients who were affected with different diseases. It was given in a wine-glassful of water. If any of the powder remained behind, it was washed down with water. Even the most excited patients offered scarcely any resistance to the taking of the medicine. Rabbas's conclusions are as follows: Sulphonal is a hypnotic which in moderate doses (30 to 45 grains) acts better and with more certainty than amylene hydrate and paraldehyde do in larger doses. Even in persons who are accustomed to narcotics its effect is successful. It is preferable to both the drugs just mentioned in respect to taste and odor. Chloral hydrate, it is true, produces sleep sooner, but its effect is not so continuous as that of sulphonal. Single doses of 30 or 45 grains usually produce a good effect in excited patients. When its administration has been continued for some time, an increase in the dose does not seem to be necessary. Sleep occurs for the most part in half an hour, more rarely in one or two hours and lasts uninterruptedly from six to eight hours or more; the sleep is entirely normal. Large doses, 60 grains, varying at short intervals with smaller doses of 30 and 45 grains, exercise no injurious influence upon the organism. In general, bad secondary effects do not occur even when the drug is given for a long time. Its absolute harmlessness as regards its action upon the heart, even when used a long time, makes it greatly preferable to chloral, the weakening effect of which upon the heart is generally known and dreaded. In a few cases sulphonal has failed.

Myxœdema and the Thyroid Gland.

At the meeting of the Clinical Society of London, May 25, Dr. Ord reported for the committee on myxœdema, appointed by the Society, the result of their investigation. These results are stated in the *Lancet*, June 2, 1888, in fourteen propositions. Without attempting to quote these at length, it may be said that the committee regards the presence of the thyroid body as absolutely essential, if there is to be no myxœdema, sporadic cretinism, or cachexia strumipriva. Complete removal or destruction of the thyroid gland, or loss of all its functions from any kind of disease, can, must and does cause myxœdema or its equivalent. If there is abolition of the thyroidic functions during early life, cretinism results; whereas, if the thyroid is slowly destroyed after puberty has been reached, myxœdema results. For the most part the destruction of the thyroid appears to be due to the growth of fibrous tissue in the organ, arresting its functions, and destroying its proper glandular tissue. It was stated by the committee that such a growth of fibrous tissue occurs in other parts of the body in cases of myxœdema.

National Association of Railway Surgeons.

The Committee for making arrangements for a National Meeting of Railway Surgeons, decided to hold the meeting in the City of Chicago in parlor O of the Palmer House, on the 28th day of June, at 9.30 A.M. It is desired that all railway surgeons attend this meeting and assist in organizing this National Association. Every surgeon who is in the employ of any railway company is invited to this meeting.

Monument to Pirogoff.

There is a movement in medical circles in Russia to erect a monument in St. Petersburg or Moscow to Pirogoff, the famous surgeon. The funds for this monument are to be raised by a general subscription throughout the whole Russian Empire.

Autopsy on the Emperor of Germany.

Telegraphic reports to the daily papers state that the post-mortem examination made upon the late Emperor of Germany was confined to a dissection of the neck, larynx and lungs. The larynx was found to have been destroyed by suppuration, and in its place was a cavity about the size of a clenched fist. Dr. Mackenzie is said to have stated that the disease was beyond doubt cancer of the larynx. He adds that the diagnosis was rendered very difficult, as the disease attacked the cartilages of the larynx at the outset, and afterwards developed chiefly in the lower part of the larynx.

A somewhat different account states that in addition to the destruction of the larynx purtrid bronchitis also existed, as the result of inspiration of putrescent particles into the bronchial tubes. The whole larynx is said to have been in a state of suppuration, presenting a soft, lumpy mass, with scarcely any trace of cartilaginous structure remaining. There was nothing to show the existence of perforation of the walls separating the trachea and œsophagus. The choking sensation from which the Emperor suffered during the last days of his life, which was attributed to such perforation, appears to have been really due to collapse of the larynx, owing to the destruction of the cartilage.

Warner and Warner.

It is somewhat surprising to find in the *Centralblatt für Chirurgie*, May 26—one of the most esteemed medical journals of Germany—an advertisement of "Warner's Safe Cure," which asserts that the remedy is already much used by physicians in their practice, that there is a depot for its sale at Frankfort-on-the-Main, and that specimen bottles will be sent free to all physicians who wish it.

It is curious that this happens just at a time when William R. Warner & Co. of this city have felt called upon to deny as calumnious, the charge or imputation that they are the makers of this preparation. In this country, the articles made and sold by Mr. Warner, of Philadelphia, are on a very different footing from the much advertised "safe cures;" and we do not wonder that he is indignant to have it intimated that he is the maker of the latter. If our German cousins knew how the "safe cures" are regarded by the medical profession here, they would hardly find such a welcome as is indicated by the advertisement we have referred to. There may be some confusion abroad in regard to the different Warners; but we think there is no confusion in regard to them here.

Hydrastis Canadensis.

Dr. Thomas Oliver, in a communication to the *Lancet*, May 5, 1888, upon clinical experience of some of the more recently introduced drugs, says of hydrastis that it certainly does restrain the flow of blood in myofibromata, but that it is in cases of menorrhagia, in which loss of blood depends upon a para- or a peri-metritis, that its efficacy is most marked. It not only relieves ovarian pain, but it has checked uterine hemorrhage in cases in which there has been such evidence of inflammation outside and immediately around the uterus, that intrauterine medication could not have been attempted. The drug has, in his hands, had little if any effect upon uterine hemorrhage dependent upon mucous polypi. It soothes ovarian pain, acute or chronic, and checks the bleeding in the latter; it checks the bleeding of endometritis, and relieves that unpleasant pain which prevents the woman thus affected from either sitting or walking; it relieves, and in many cases, he says, has arrested the hemorrhage due to puerperal metritis and chronic peritonitis; and in many instances it has relieved the headache so frequently complained of by women who are the subjects of chronic inflammatory affections in and around the uterus and ovaries.

In cases of pelvic peritonitis, associated with ovarian pain and uterine hemorrhage, the combination of hydrastis and salix nigra, he says, has proved of signal service. Further, in the highly nervous condition into which some women are so frequently thrown soon after the climacteric, salix nigra and hydrastis canadensis in combination, have answered well.

Suicides in London and New York.

The *Lancet*, June 2, 1888, from an examination of the statistics of suicides occurring in New York and in London, concludes that in New York suicide is, generally speaking, committed at an earlier age than in London. It admits, however, that this may be due to the much larger foreign element in New York as compared with London, as there is good reason, it says, for believing that an examination of the ages at which suicides are committed in Continental Europe would show that suicides take place there at an earlier age than they do in England.

Rachitis.

Schwarz (*Medizinische Jahrbücher*, 1887), has demonstrated, by an examination of 500 children within an hour after birth, at the lying-in hospital in Vienna, that the signs of rachitis can usually be found at that early period, showing the disease to be, at least usually, intra-uterine in its commencement. To a very large extent he confirms the usual impressions regarding etiology and pathology. Of the 500 children examined, 97 were without sign of this disease, 188 had well marked rachitic rosaries, together with rachitic changes of the cranial bones, varying from an abnormal weakness along the borders of the sagittal suture to an almost complete defect of ossification of the cranium; 155 had well marked rachitic rosaries without the changes in the cranial bones; 36 had the changes in the cranial bones alone, and 24 presented only slight swellings at the union of the bones and cartilages of the ribs. Of the children born in the seventh lunar month, 14 were rachitic, 1 normal; in the eighth lunar month, 27 rachitic, 4 normal; in the ninth lunar month, 50 rachitic, 12 normal. Fifteen of the mothers of rachitic children presented signs of having suffered from a high grade of rachitis. Of six cases of twins, in three one child was normal, while the other was rachitic; in the others both children were rachitic. His conclusion is that every child should be examined as soon after birth as practicable, and, if any signs of rachitis are found to be present, active treatment should be immediately instituted.—*N. Y. Medical Journal*, March 31, 1888.

The Incompatibility of Antiseptics.

Dr. Boxall calls attention to a very important point in connection with the employment of mixed antiseptics. He has ascertained that mixtures of corrosive sublimate and iodine, iodine with carbolic acid, and carbolic acid and olive oil, produce chemical changes which materially affect the properties of the original constituents. He found, moreover, that soap and glycerine are, as a rule, bad vehicles for antiseptics. Perchloride of mercury, iodine, salicylic acid, and permanganate of potassium are changed or precipitated by admixture with soap. It is evident, therefore, that some little discrimination is necessary before we employ other than simple solutions of the principal antiseptics.—*Medical Press and Circular*, May 2, 1888.

Purpura Hemorrhagica after a Mental Shock.

Dr. Ed. de Smet, of Brussels, has recently had a case in which a young woman of a highly nervous temperament, in consequence of a severe fright, experienced an eruption of purpura hemorrhagica, though she had never had any eruption of the kind before. Some four months subsequently, however, in consequence of a fall, a similar eruption made its appearance. The treatment was directed mainly to the nervous system, which had evidently been very much affected. The author refers to M. Lenoir, of Lille, who has published cases of various skin diseases—eczema, psoriasis, herpes, pemphigus, and vitiligo—which have followed a mental shock.—*Lancet*, March 17, 1888.

Antiseptic Ammunition.

A useful suggestion is just being carried out by the Netherland Government, by which provision will be made for supplying each soldier, during the time of war, with a cartridge containing some antiseptic dressings. Each cartridge will be made of convenient size, namely about ten centimetres in length, by five in width, and will be secured at one end with a safety pin. The dressings contained in each will consist of a bandage, about three metres long, and two pieces of gauze, all of which have been rendered antiseptic by a sublimate solution. Hence, in the event of wounds being received a ready means would be at hand for the immediate application of antiseptic dressings. Soldiers, in the case of slight injuries, would probably at once avail themselves of the dressings, and the latter could not fail to be of much use to the surgeons. The idea is well worthy of the attention of the military authorities in this country, and might even with advantage be adopted, as it has been for years past in the German army. In the wars in which, during the past few years, we have been engaged in tropical climates, the early application of antiseptics to the wounds received by the men was admitted to be a matter of the utmost importance by the army medical officers attached to the forces.—*Medical Press and Circular*, May 9, 1888.

Accident from the Explosion of Chlorate of Potassium Tablets.

The *Canada Pharmaceutical Journal*, June, 1888, says: A prominent tenor of this city was lately engaged to sing at the opening ceremony of one of our churches, and feeling somewhat hoarse, supplied himself with

some tablets of chlorate of potassium, which he put into his pocket, which also contained matches. Just before the critical moment of the performance he had recourse to the remedy, and, fumbling hastily in his pocket, produced friction sufficient to initiate an interesting reaction, which is, however, more adapted to the chemical lecture desk than the platform of the vocalist. The result was striking and produced a decided sensation, and though it was at first feared that the singer had lost several important vital organs, it was found on investigation that he escaped with some damage to his clothing, and a very severe burn on his hand.

Treatment of Penetrating Gun-Shot Wounds of the Cranium.

Dr. Joseph D. Bryant, in a paper read before the Medical Society of the State of New York (*N. Y. Med. Journal*, May 5, 1888) concludes that:

1. A bullet should be removed from the brain as soon after its reception as its situation can be determined and the patient's condition will permit.

2. A bullet should be removed from the brain at a later period if symptoms supervene and it can be located.

3. A bullet that has been located in the brain and has not been removed, should be removed before the supervention of symptoms, when it assumes a migratory character.

4. No effort should be made to remove a ball from the brain if it cannot be located.

Pigmentations in Pregnancy.

The *Journal of Cutaneous and Genito-Urinary Diseases*, May, 1888, says Dr. Monin recommends the following:

℞ Cocoa butter,
Castor-oil āā ..... ℥iiss
Oxide of zinc..... gr. v
White precipitate..... gr. ij
Essence of rose..... gr. ij–x

M. S.—Apply morning and night.

—The bill abolishing hanging for all murders committed after January 1, 1889, and providing that the execution in New York shall be carried out by the use of electricity, was signed June 4 by Governor Hill. The bill further provides that the court delivering the sentence shall name merely the week within which the execution shall take place, the day of execution being left to the discretion of the principal prison officer.

NEWS.

Dr. Mark Hovell threatens to sue the London *Times* for publishing assertions with reference to his action in the case of the late Emperor of Germany, which are regarded by Dr. Hovell as libellous.

—Some of the Dublin Hospitals are to receive large sums of money from the estate of the late Mr. William Bannon. The amount which each of the favored hospitals will receive has been estimated at thirty thousand dollars.

—Dr. Paul F. Mundé will give the lectures on Gynecology before the Dartmouth Medical College this year, and Dr. William H. Parish those on Obstetrics. The vacancy caused by Dr. Dunster's death has not yet been filled.

—The French Academy of Sciences is interested in regard to the recent discovery of a sulphurous mineral water in the very heart of Paris. While digging for the foundations of a hospital building on the Ile Saint-Louis, sulphurous springs were found at a depth of about 35 feet from the surface.

—The *Deutsche med. Wochenschrift*, April 12, 1888, informs its readers that it has been discovered that "Gleditschine" is a mixture of atropine and cocaine! If the Germans had been using this now long-exploded mixture, they would no doubt have found out sooner that it had but a brief day in America.

—The faculty of Harvard Medical College has recommended the following appointments to the Board of Overseers: Dr. Frederick I. Knight to be Professor of Laryngology; Dr. William H. Baker to be Professor of Gynecology, and Dr. Clarence J. Blake and Dr. J. Orne Green to be Professors of Otology and Clinical Otology.

—The Philadelphia *Ledger*, May 28, 1888, says: "Rev. Dr. Newman, the newly elected M. E. Bishop—Dr. Lawrence, a noted spiritualist declares—was once persuaded to try for a serious ailment a remedy which was obtained by spiritualistic mediumship, and was cured by it. None genuine unless the name of the medium is blown on the bottle."

—A Chest and Throat Dispensary has been inaugurated at 411 Spruce Street, this city, under the auspices of the city mission of the Protestant Episcopal Church. Drs. F. P. Henry, Thos. J. Mays and Wm. M. Angney constitute the medical staff of the Chest Department, and Drs. A. W. Watson and C. Jay Seltzer that of the Throat Department.

—Basing his statement on an exhaustive study of official documents, M. Marambat stated, at a recent meeting of the Academy of Medicine of Paris, that the increase in crime is in a large measure due to the use, or rather the abuse of spirits. He has been enabled to obtain positive data in the case of 3,000 prisoners, among whom there were 2,124 confirmed inebriates: a proportion of 72 per cent.

—The Pennsylvania State Dental Society held its annual session in Philadelphia, June 7, at the College of Physicians. A number of interesting papers were read, and an animated discussion was held as to the admission of visiting members of the medical and dental professions to the meetings, and upon a majority vote to take part in the discussions. The motion was made by Dr. Truman, but was finally voted down.

—At the competitive examination held by the Board of Charities and Correction to select a successor to Miss Fisher as head of the Training School for Nurses at the Philadelphia Hospital, Miss Marian E. Smith was the successful candidate. Miss Smith was formerly one of Miss Fisher's assistants at the Philadelphia Hospital, which she left in order to accept the position of Superintendent of the Training School at the Pennsylvania Hospital.

HUMOR.

LOOK OUT FOR THE MAN who is advertising an infallible cure for a corn, price $1, and money refunded if the corn does not disappear. If you send him a dollar you will receive by return mail the following recipe: "Cut off your toe."

THIS IS TRULY AN AGE OF ICONOCLASM. A cold-blooded scientist now comes forward to say that the old oaken bucket, celebrated in song and story, is simply an iron-bound death dealer, a condensed mass of nitrogenous and phosphatic filthiness, and the home of the microbe and bacterium.

"I HAVE A GOOD MIND to lay off and rest a couple of weeks," said a young journalist, wearily, as he finished a thrilling ten-line notice of Brown's bakery and leaned back in his chair. "You have that," warmly exclaimed the grizzly old newspaper man, who was wrestling with two columns of telegraph and a stack of proof. "You have the best mind to rest with that I ever saw."—*Exchange.*

MAGISTRATE (to prisoner)—"You say, Uncle 'Rastus, that you took the ham because you are out of work and your family are starving. And yet I understand that you have four dogs about the house." Uncle 'Rastus—"Yes, sah, but I wuddent ask my family to eat dogs, yo' honah!"

THE OTHER DAY AN EXQUISITE told the daughter of a prominent official—an unusually clever young woman—that he always slept in gloves because it made his hands so soft.

"Do you sleep in your hat, too?" artlessly inquired the damsel.

There was no reply; and I half suspect that the young man thought at the moment that his fair questioner was out of her mind. —*Boston Journal of Health.*

MARRIAGE.

SEYBERT—WIESS.—June 20, 1888, Dr. Frank F. Seybert (Jeff. Med. Col., 1881) to Ida B., daughter of Mr. and Mrs. F. Ferd. Wiess, of Council Bluffs, Iowa.

OBITUARY.

DR. DAVID MERRITT.

Dr. David Merritt, who recently died at his residence in Philadelphia, was born at St. John, New Brunswick, in 1830. He came to this city when nineteen years of age, and began the study of medicine, and was graduated at the Pennsylvania Medical College in March, 1851. He practised his profession until the breaking out of the war, when he joined the 55th Regiment, Pennsylvania Volunteers, under Colonel Richard White. After serving three years as surgeon with that body, he connected himself with the Hancock Veteran Corps, serving in the same capacity until the close of the war. He resumed his practice in this city, and three years ago he had an attack of empyema, which eventually caused his death. He leaves a widow, a son and a daughter.

CARL L. JENSEN, M.D.

Carl L. Jensen, a well-known manufacturing chemist, who resided at No. 2039 Green street, Philadelphia, died of typhoid fever in New York City, June 9, after a short illness. He was in his 43d year, and was born in Denmark, graduating as a chemist at Copenhagen. He came to this country in 1869, and for the last eight years lived in Philadelphia, where he devoted himself to the manufacture of preparations of pepsin. He leaves a widow and three children.

JOHN WIEGAND SNOWDEN, M.D.

Dr. John Wiegand Snowden was born in Philadelphia, April 22, 1823. He was the son of Thomas and Sarah M. Snowden. His father was for over thirty years associated in business with John Wiegand, as manufacturers and importers of surgical instruments in Philadelphia. Thomas Snowden took an active part in public affairs in Philadelphia prior to 1854, and represented the old South Mulberry ward for many years in its Common and Select Councils, serving for ten years as President of the former.

Dr. Snowden was educated at the Engle Classical School in Philadelphia. He assisted Dr. George McClellan as demonstrator of anatomy, and was graduated from the Medical Department of the University of Pennsylvania in 1844. He began the practice of medicine in his native city, but soon removed to Middletown, Delaware, and thence to Chew's Landing, Camden county, New Jersey. He was of feeble constitution, and subject to pulmonary diseases. Learning from the natives that a residence in the barrens of New Jersey, called the Pines, was a sovereign remedy for these affections, he removed in 1846 into what was then the centre of that wilderness, near where is now the Ancora Station, on the Camden and Atlantic Railroad. In June, 1849, he joined the Camden County Medical Society, and was at his death the oldest member on its roll. He had filled all the important offices in the Society, having been twice its President, and for nine years Chairman of its Standing Committee, resigning in 1887, in consequence of ill health. He was a member of the New Jersey State Medical Society, and its President in 1882. He was also a member of the American Medical Association, and of the Obstetrical Society of Philadelphia.

A few years before his death he removed from Ancora to Hammonton, six miles below the former place, and just within the limits of Atlantic county, where he died May 28, 1888.

At a special meeting of the Camden County Medical Society, held May 30, 1888, the following was ordered to be placed upon the minutes:

In the death of Dr. John W. Snowden, who was a member of this Society for thirty-nine years, who rarely was absent from its meetings, who filled its highest posts of honor, maintained its dignity, and used his rich fund of experience and ripe judgment in the interest of harmony, this Society has sustained a great loss.

We commend to the members of the Society this bright example of the *true physician*, one who for forty years, by night and by day, in sunshine and in storm, devoted talents worthy of a more brilliant theatre, to the people of a sparsely settled district, and ministered with great medical skill to alleviate their sickness and sufferings, and often with true Christian piety furnished them with spiritual consolation.

We extend to his bereaved family our sincere sympathy in their sorrow and loss, knowing that, although his place cannot be filled, their and our remembrance of him will be of one who in all his relations in life, both public and private, was the embodiment of purity, honor and dignity.

H. Genet Taylor, M.D.,
E. P. Townsend, M.D.,
E. L. B. Godfrey, M.D.,
Daniel Strock, M.D.
J. F. Walsh, M.D.,
Committee.

RACHEL L. BODLEY, M.D.

Dr. Rachel L. Bodley, Dean of the Women's Medical College of Pennsylvania, died at Philadelphia, June 15. She had been suffering with heart trouble, but was not taken seriously ill until June 12, when she began to fail rapidly.

Dr. Bodley was born in Cincinnati, O., December 7, 1831. In 1844 she entered the Wesleyan Female College, in that city, and was graduated after a course of five years. She was then appointed a teacher and remained until 1860, advancing to the position of preceptress in the higher collegiate studies. She came to Philadelphia in the autumn of that year, and became a special student in advanced chemistry and physics in the Polytechnic College. She returned to Cincinnati in February, 1862, and was appointed Professor of Natural Sciences in the Cincinnati Female Seminary, which position she held three years. In 1865 she was called to the chair of chemistry and toxicology in the Women's Medical College of Pennsylvania. She accepted and thus became the first woman professor of chemistry. She was elected Dean of the Faculty in January, 1874, and from that time until her death she devoted herself exclusively to the college, promoting its interests and striving to elevate her sex, and to secure for woman and her work respect and recognition.

In 1879 the honorary degree of M.D. was conferred upon her by the Women's Medical College of Pennsylvania.

In 1880 she was made a member of the Franklin Institute, and was the first woman to deliver any extended course of lectures in the Institute.

Not the least of her services to the city was her service as School Director of the Twenty-ninth Section School Board, which position she held at the time of her death.

DETROIT COLLEGE OF MEDICINE.

SESSION 1888-89.

Clinical and Practical teaching are made an important feature of this College. Clinical instruction is given daily at HARPER, ST. MARY'S and ST. LUKE'S HOSPITAL, at the COLLEGE, at COLLEGE EYE and EAR INFIRMARY, ST. MARY'S FREE EYE and EAR INFIRMARY, and at the three FREE DISPENSARIES. The facilities offered by this college are unsurpassed for the practical study of MEDICINE, SURGERY, OBSTETRICS, GYNÆCOLOGY, DISEASES OF CHILDREN, GENITO-URINARY, and ORTHOPÆDIC SURGERY, OPHTHALMOLOGY and OTOLOGY, DERMATOLOGY and LARYNGOLOGY.

REGULAR SESSION opens on Wednesday, September 26, and continues six months. During the session the Professors will take special pains to examine the Students upon the subjects of the previous lectures.

SPRING SESSION begins March 27th, 1889, and closes June 17th.

FEES.—Matriculation fee, $5: Fees for Regular Session, $50; Spring Session, $10, to those who attend the regular term, to all others, $25; Hospital Fee, $10; Graduation Fee, $30; Perpetual Ticket, $100.

For further particulars, and for College Circular, apply to

H. O. WALKER, M.D., Secretary,

33 Lafayette Ave., Detroit, Mich.

HORSE AND CARRIAGE
FOR SALE.

A physician in Philadelphia who is cutting off his visiting practice wishes to sell a valuable mare and a first-class Germantown wagon, one year old. Harness and saddle, and rugs and an old sleigh can go together at a low price.

Address,

"CASTOR,"

Office of Med. and Surg. Reporter.

BAKER'S COD LIVER OIL AND Malt.

A combination of equal parts of these two potent remedies, in which the taste of oil is completely masked and rendered quite palatable.

The tonic and nutritive properties of both the Oil and Malt should recommend this article to universal favor.

Baker's Pure Norwegian Cod Liver Oil.

Established 1830.

Put up in our capsuled bottles with steel engraved label. Will always be found of unequalled quality, and sure to yield the most satisfactory results.

BAKER'S EMULSION.

C. L. Oil with Hypo-phosphites. Made with our unequalled Norwegian Oil, rendering it by common consent the Best Emulsion in the market.

JOHN C. BAKER & CO.,

815 Filbert Street, Philadelphia.

BURN-BRAE.

This Hospital, founded by the late R. A. Given, M.D., 1859, and designed for the care and treatment of a limited number of cases of **Mental** and **Nervous Disorders**, is located at Clifton Heights, Delaware Co., Pa., a few miles west of Philadelphia. Primos Station, on the Philadelphia and Media Railroad, is within less than ten minutes' walk.

Burn-Brae has been in operation for more than a quarter of a century, and numbers its friends in all sections of the country. With **extensive grounds**, handsomely laid out, building attractive in appearance, a wide and varied view, bed-rooms large, cheerful, and well furnished, heating facilities perfect, light abundant, with constant professional supervision, **Burn-Brae** offers, for the care and treatment of its inmates, a pleasant, safe and healthful HOME.

Resident Medical Officers:

THERAPEUTICS OF DIPHTHERIA.[1]

BY A. JACOBI, M.D.,
CLINICAL PROFESSOR OF DISEASES OF CHILDREN IN THE COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK, ETC.

[Continued from page 802.]

The liquids which are to be injected must be warm and fairly mild. Solutions of chloride of sodium, two-thirds of one per cent.; saturated solutions of boric acid; one part of bichloride of mercury, 35 of chloride of sodium and 5000 of water, more or less; or lime water, or solutions of papayotin, will be found satisfactory. From the selection of these remedies it is at once apparent that the object in view is partly that of washing out and partly of disinfecting. I have not mentioned carbolic acid, which may be used in solutions of one per cent. or less. Its employment requires care, for much of the injected fluid is swallowed, and proves a danger to children of any age, but mostly to the young.

Most of the syringes I find in my rounds are abominations. The nozzle must be large, blunt and soft. After having recommended for many years the common hard rubber ear syringe, the sharp end of which was cut off, I now use always a short stout glass syringe, with soft rubber mounting in front.

When the children cannot, or must not be raised, I employ the same solutions from a spoon, or a plain Davidson atomizer. These applications can thus be made while the children are lying down, every hour, or very much oftener, without any or much annoyance. The nozzle must be large, so as to fit the nostril. A single spray on each side will generally suffice. I am in the habit of covering the common nozzle with a short piece of india-rubber tubing. For a day or two these injections of fluids or sprays must be made hourly. It is not cruel to wake the children out of their septic drowsiness—it is certain death not to do it.

Injections of the nose are oftener ordered than judiciously made. Hundreds of times have I been assured that they had been made regularly, hourly, for days in succession. Still there was a steady increase of glandular swelling and sepsis. I never believe a nurse to have made them regularly unless I have seen her doing it. They *will* turn up their syringe vertically, and not horizontally; the fluid *will* return through the same nostril. On the successful injecting or spraying of the nares hangs every life in a case of nasal diphtheria. I have long learned to look upon a neglect to tell at every visit how to make an injection, as a dereliction of duty. This may appear a trifling way, but it is a safe one. The nurse must be made to tell you that at every injection the fluid returns through the other nostril, or through the mouth, or is swallowed.

The procedure is simple enough, and need not take more than half a minute for both nostrils. A towel is thrown over the child's chest up to the chin and the child gently raised in bed by the person who is to make the injection. This person sitting on the bed steadies the patient's head against her chest while somebody else holds the patient's hands. The syringe is introduced horizontally, by the person sitting behind the patient and gently emptied. No time must be lost in refilling and attending to the other side. When pain is complained of in the ears more gentleness is required, or the spray, or pouring from a spoon, or minim dropper even, has to take the place of the injection. Many sins are committed in even doing

[1] A paper read at the meeting of the Philadelphia County Medical Society, May 23, 1888.

this simple thing. The unfortunate little one is made to see all the preparations and is worried and excited, and the necessary gentleness in the proceedings is neglected. The cases reported by me in a discussion on the local treatment of diphtheria before the Section on Theory and Practice in the New York Academy of Medicine, read as follows: [1]

"There were two trained nurses, and two children of six and four years. When I saw the little four-year-old the other was dead. Where did he die? His head between the knees of the trained nurse. They had been told Dr. Jacobi ordered nasal injections to be made every hour in such cases. Every hour the unfortunate boy was lugged out of bed, protesting and fighting, and wearing out his little strength in his battle against two trained brutes; had his head rammed between the knees of one of them who was herself comfortably seated on a chair while the other did the rest; and thus the boy was murdered. When I heard that fearful story from the smiling lips of that person, I begged and pleaded, and showed her how to do it gently. A week afterward the doctor told me that the little girl died between the knees of one of the smiling creatures, and neither of them is in the State prison."

What is the concentration in which antiseptic injections should be used? For twenty-five years and more, while employing irrigations and injections frequently, I had used quite weak solutions and felt assured of their efficacy. All at once (when the gospel of the bacteria was being preached) it was claimed that weak solutions were useless and a snare, because antiseptics, and particularly carbolic acid, would not destroy bacteria and bacteria-poisons except in such doses and concentrations as would necessarily destroy blood and tissues first. I felt dismayed, but still continued in my heretic ways, hoping that improved knowledge would finally harmonize theory and practice. So it happened. In the *American Journal of the Medical Sciences* for January, 1881, T. Mitchell Prudden proved that a solution of one-sixteenth of one per cent. of carbolic acid prevents the emigration of white-blood corpuscles under circumstances otherwise favorable to inflammation; and Koch found that though bacteria are not easily killed, their growth is stopped by a solution of one part of carbolic acid in 850, and their activity by one in 1200. These effects are all that is required for practical purposes; thus the frequency of applications is justified by both necessity and safety.

[1] *N. Y. Medical Record*, 1887, p. 403.

Diphtheritic adenitis, the swelling of the cervical glands near the angles of the lower jaw, to which I have alluded as an ominous symptom, points to nasal and nasopharyngeal infection. The treatment consists in disinfection of the absorbing surfaces.

Direct local treatment of the glands, if not entirely useless, is, at all events, of minor importance and efficiency. Applications of one part of carbolic acid to ten of alcohol, irritate both surface and patient more than they can do good. Inunctions may do some good by friction (massage); inunctions with some absorbable material in them may do a little better. The common iodide of potassium ointment is useless; iodide of potassium in three or five parts of glycerine is more readibly absorbed; the same in equal parts of water, with a little animal fat, and six or eight times its quantity of lanolin, gives an ointment which is readily absorbed. Iodine is found in the urine within a few hours. Iodoform may be utilized in the same way. Injections of iodoform in ether, which I suggested some time ago, are too painful. Mercurial inunctions, those of blue ointment, require too much time for any effect to take place. Oleates are too irritating locally; a lanolin ointment would prove more satisfactory. After all, however, the readiest method of reducing the swelling of the glands, and improving the prognosis accordingly, is that of cleansing and disinfecting the field of absorption. The rare cases of suppuration in these glands require incision and disinfection. They are as ominous as rare, however. There is but little pus, as a rule, but one or many local deposits of disintegrated gland cells and gangrenous connective tissue. The incisions must be extensive, the scoop and concentrated carbolic acid must be freely used. In these cases hemorrhages may occur, some of them very difficult to manage. I have seen some of them terminate fatally. In these carbolic acid must be avoided. Compression, actual cautery, and acupressure, have rendered good service. Solutions of iron must be avoided, for the scurf formed is a shield behind which deleterious absorption is going on constantly in such wounds, as it does in the uterus.

Besides sepsis, the great dangers in diphtheria are heart failure and strangulation. The latter has its own indication, to which I shall not allude to-day. Heart failure exhibits itself sometimes quite suddenly, but, as a rule, it is foreshadowed by a gradually increasing frequency, weakness of heart-beats and pulse, and the equal length of the intervals between the feeble systole and diastole,

and diastole and systole. This equality is always a dangerous symptom. Heart failure is due, besides the influences common to every disease and every fever, to myocardial changes. These may depend on the influence of septic decomposition of the blood, and the ill-nutrition of the heart-muscle depending thereon, or on the direct diphtheritic changes of the tissue, or both. These changes and dangers set in, sometimes, at a very early period. Thus whatever enfeebles must be avoided. Patients must be spared every unnecessary activity. They must remain in bed, without excitement of any kind, take their meals, and evacuate their bowels in a recumbent or semi-recumbent position; crying and worrying must be avoided; the room kept airy, and rather dark, so as to encourage sleep if the patient be restless. In no disease, except, perhaps, in pneumonia, have I seen more fatal results from sudden changes of posture, or from exertion. Unless absolute rest be enforced, neither physician or nurse has done his or her duty.

The threatened feebleness of the heart yields a positive therapeutical indication. In no disease is the danger greater on the side of the heart, in no disease is the indication for sustaining and strengthening the heart more positive from the very beginning. Digitalis, strophanthus, sparteine, besides camphor, alcohol and musk, must not be postponed until feebleness and collapse have set in. It is possible, or probable that they will appear; and it is certain that a cardiac stimulant will do no harm. It is safe, and advisable to use them at an early date. This is especially necessary when antipyrine or antifebrine is given. A few grains of digitalis, in a palatable and digestible form, may, or must, be given daily. When a speedy effect is required, one or two doses of from two to four grains are not too large, and must be followed by smaller ones. When it is justly feared that the effect of digitalis may be too slow, I give, with or without the former, sulphate of sparteine. An infant a year old will take one-tenth of a grain four times a day, as a matter of precaution, and every hour or every two hours in an emergency.

Of at least the same importance as cardiac tonics are alcoholic stimulants. The advice to wait for positive symptoms of heart failure and collapse before the life-saving apparatus is employed, is bad. There are cases which get well without treatment, but we do not know beforehand which they will be. No alleged mild case is safe until it has recovered. When heart failure sets in—and often it will occur in apparently mild cases—our efforts are too often in vain. Thus alcoholic stimulants ought to be given early, and in large quantities, though amply diluted. There is no such thing as intoxication or danger from it, in septic diseases. A few ounces daily may suffice, but I have seen ten ounces daily of brandy or whiskey save children who had done badly with three and four.

Coffee is a good stimulant for the heart. Camphor may be employed to great advantage for the same purpose. From five to twenty-five grains may be given daily, as camphor water, or in a mucilaginous emulsion, which is easily taken. It does not upset the stomach as ammonium carbonate is liable to do. It may be employed subcutaneously when a rapid effect is aimed at, in five parts of oil, which is milder and more convenient than ether.

But the best internal stimulant, in urgent cases, is Siberian musk, in powders, or with mucilage. When required at all it ought to be given in sufficient doses, and at short intervals. When ten or fifteen grains administered to a child one or two years old, will not accomplish, within three or four hours, a return of a more satisfactory heart's action, the prognosis is very bad.

Besides exhaustion at the height of the disease, we have paralysis during convalescence, or intense anæmia long after apparent recovery. This anæmia may be general, or is local, and then mostly cerebral.

Diphtheritic paralysis, though of different anatomical and histological origin, yields in all cases a certain number of identical therapeutical indications. These are: The sustaining of the strength of the heart by digitalis and other cardiac tonics. A child of three years may take daily, for a month, three grains or its equivalent; for instance, one grain of the extract. This is an indication on which I cannot dwell too much. Many of the acute, and most of the chronic diseases of all ages, do very much better by adding to other medications a regular dose of a cardiac tonic. It is true that it is a good practice to follow the golden rule to prescribe simply, and, if possible, a single remedy only, but a better one is to prescribe efficiently. A prescription paper with a single line on it looks well, but a readily convalescent or well man, looks better.

Besides, there are some more indications: Mild preparations of iron, provided the digestive organs are not interfered with. Strychnia or other preparations of nux vomica at all events. In ordinary cases a child of three years will take an eightieth of a grain three or four times a day. Local friction, massage of the throat, of the extremities, and trunk, dry or

with hot water, or oil, or water and alcohol; and the use of both the interrupted and continuous currents, according to the known rules, and the locality of the suffering parts, find their ready indications. The paralysis of the respiratory muscles is quite dangerous; the apnœa resulting from it may prove fatal in a short time. In such cases the electrical current used for very short periods, but very frequently, and hypodermic injections of sulphate of strychnia in more than text-book doses, and frequently repeated, will render good service. I remember a case in which these, and the occasional use of an interrupted current, and occasional artificial respiration by Silvester's method, persevered in for the better part of three days, proved effective.

Chloride of Iron.—I am still, as I was in my first paper on diphtheria, in 1860, an advocate of the internal use of chloride of iron. Its mode of administration I have not changed much these twenty years. In a public lecture delivered before a New York audience, by an European authority, whose name has lately appeared a little more prominently in the newspapers than an American physician would wish, I was highly praised for giving a few drops of the tincture of the chloride of iron a few times a day. This eulogy I have always tried not to deserve, for the efficient method of its administration is not that. The chloride of iron is an astringent and antiseptic. Its contact with the diseased surface is as important as is its general effect; therefore it must be given frequently, in hourly or half hourly doses, even every twenty or fifteen minutes. An infant of a year may take three or four grammes a day, a child of three or five years, eight or twelve. It must be mixed with water to such an extent, that the dose is half a teaspoonful or a teaspoonful; a drachm in four ounces allows half a teaspoonful every twenty minutes. No water must be drunk after the medicine. As a rule, it is well tolerated. There are some, however, who will not bear it well. Vomiting or diarrhœa is a contra-indication to persevering in its use, for nothing must be allowed to occur which reduces strength and vigor. A good adjuvant is glycerine, better than syrups. From ten to fifteen per cent. of the mixture may consist of it. Now and then, but rarely, it is not well tolerated either. When diarrhœa sets in glycerine must be discontinued. Still these cases are rare; indeed, the stomach bears glycerine very much better than the rectum. In the latter, the presence of a small dose of glycerine is known sometimes to produce large evacuations, a result appropriated and utilized by an advertising nostrum monger.

In connection with this remedy, I wish to make a remark of decidedly practical importance. I know quite well that recovery does not always prove the efficacy of the remedy or remedies administered. But I have seen so many bad cases recover with chloride of iron, when treated after the method detailed above, that I cannot rescind former expressions of my belief in its value. Still, I have often been so situated that I had to give it up in peculiar cases. These are cases in which the main symptoms are those of intense sepsis, I should say cases in which the iron and other rational treatment was not powerful enough to prevent the rapid progress of the disease. Children with naso-pharyngeal diphtheria, large glandular swelling, feeble heart and frequent pulse, thorough sepsis, and irritable stomach besides, those in which only large doses of stimulants, general and cardiac, can possibly promise any relief, are better off without the iron. When the circumstances are such as to leave the choice between iron and alcohol, it is best to omit the iron and rely on stimulants mostly. The quantities required are so great that the absorbent powers of the stomach are no longer sufficient for both.

Nor is iron sufficient or safe in those cases which are preëminently laryngeal. To rely on iron in membranous croup means waste and danger.

Mercury.—The first volume of *A system of Practical Medicine by American Authors*, which appeared in 1885, contains in an article on diphtheria, written in 1884, the following remarks on page 705 :

"Not all cases of diphtheria are septic or gangrenous, nor are all the cases occurring during an epidemic of the same type. Some have the well-pronounced character of a local disease, either on the tonsils or in the larynx. The cases of sporadic croup, met with in the intervals between epidemics, present few constitutional symptoms, and assume more the nature of an active inflammatory disease, very much like the sporadic cases of fibrinous tracheo-bronchitis. These are the cases in which mercury deserves to have friends, apologists, and even eulogists. Calomel, 0.5–0.75 gramme (grs. viii–xii), divided into thirty or forty doses, one of which is taken every half hour, is apt to produce a constitutional effect very soon. Such, with minute doses of one milligramme (gr. $\frac{1}{60}$), or more, of tartar emetic, or ten or twenty times that amount of oxysulphuret

of antimony, have served me well in acute fibrinous tracheo-bronchitis. But the mucous membrane of the trachea and bronchi is more liable to submit to such liquefying and macerating treatment than the vocal cords. The latter have no muciparous glands like the former, in which they are very copious. And while the tracheal pseudo-membrane, though recent, is apt to be expelled through a tracheal incision at once, that of the vocal cords takes from six days to sixteen or more for complete removal. Still, a certain effect may even here be accomplished, for maceration does not depend only on the local secretion of the muciparous glands, but on the total secretion of the whole surface, which is in constant contact with the whole respiratory tract. Thus, either on theoretical principles, or on the ground of actual experience, men of learning and judgment have used mercury in such cases as I detailed above, with a certain confidence.

"If ever mercury is expected to do any good in cases of suffocation by membrane, it must be made to act promptly. This is what the blue ointment does not. In its place I recommend the oleate, ten or twelve minims of which may be rubbed into the skin along the inside of the forearms or thighs, or anywhere else when those surfaces become irritated, every hour or two hours. Or repeated doses will be useful such as mentioned before, or hypodermic injections of corrosive sublimate, in one-half or one per cent. solution in distilled water, four or five drops from four to six times a day or more, either by itself, or in combination with the extensive use of the oleate, or with calomel internally. Lately, the cyanide of mercury has been recommended very strongly. I hardly believe that it will work more satisfactorily than any other equally soluble preparation. Within the past few years the internal administration of bichloride of mercury has been resorted to more frequently and with greater success than ever before.

"My own recent experience with it has been encouraging, and so has that of some of my friends. Wm. Pepper gave one-thirty-second of a grain of corrosive sublimate every two hours in a bad form of diphtheritic croup, with a favorable result. But in this very bad case, desperate though it was—a child of five years, respiration 70, pulse 160—large membrane 'evidently from the larynx' had been expelled before the treatment was commenced on the seventh day of the disease. The solution ought to be given in solution of 1 : 5000, and in good doses. A baby, a year old, may take one-half grain every day many days in succession, with very little, if any, intestinal disorder, and with no stomatitis. A solution of the corrosive sublimate in water is frequently employed of late as a disinfectant. It acts as such in a dilution of 1 in 20,000. As healthy mucous membranes bear quite well a proportion of 1 : 2000 or 3000, any strength between these extremes may be utilized. A grain of the sublimate in a pint or more of water, with a drachm of table salt, will be found both mild and efficient. As a gargle and nasal injection it will be found equally good. But it has appeared to me that frequent applications give rise to a copious mucous discharge; hourly injections into a diphtheritic vagina become quite obnoxious by such over-secretion, which ceases at once when the injections are discontinued. Thus, when it is desirable not only to disinfect, but also to heal the diseased surface, the injections with corrosive sublimate appear to yield a result inferior to less irritating applications."

These remarks of 1884 constitute what I consider a great progress over the statements of my treatise on diphtheria, 1880, which are more cautious and negative. Extensive experience with the remedy increased my favorable opinion of its efficiency to such an extent as to induce me to publish a number of cases and conclusions in the *Medical Record* of May 24, 1884.

They have been amply justified by the observations of the last four years, so that I am fully prepared to commit myself to the following statements: My conviction of the utter uselessness of internal medication in laryngeal diphtheria, membranous croup, is strongly shaken. The mortality of 90 or 95 per cent. of the cases not operated upon has no longer existed these five or six years, in my observation. The above figures were by no means taken from small numbers. For since 1860 I have performed tracheotomy more than 500, perhaps 600, times, have assisted in as many more operations, and seen at least a thousand cases of membranous croup which were not operated upon at all. During the last six years I have seen no less than 200 cases, perhaps many more. Amongst them, recoveries have not been rare. In the practice of no less a man than O'Dwyer, I have seen two cases of general and laryngeal diphtheria in the same family which got well without any operative procedure. Such recoveries have taken place in all ages, from four months upward. The uniform internal medication consisted in the administration of the bichloride of mercury. The smallest

daily dose was a quarter of a grain (15 milligrammes). Half a grain daily continued through five or six, sometimes eight, ten, or even twelve days, has not been rare amongst children of from three to six years. The doses varied from one-sixtieth to one-fortieth of a grain, and sometimes more. They are given every hour. They require dilution in a tablespoonful of water, or other compatible fluid, for instance milk, in order to be quite innocuous. They are not liable to produce gastric or intestinal irritation. When the latter occurred, it was generally found that by some mistake the solution was as strong as 1-2000 or 1-3000. In the few cases in which it did exist, or was believed to result from the remedy, a few minims of camphorated tincture of opium administered with every dose, for a short period, proved sufficient to check it. The beneficial effect of the remedy depends greatly upon the time of its administration. As a rule, such complete stenosis as necessitates surgical interference, develops only after days. This necessity is often obviated by the remedy when given as detailed. When the operation is required after all, the treatment must be continued. I have never since 1863 seen so many cases of tracheotomy getting well as between 1882 and 1886, when the bichloride was constantly used as mentioned. Nor am I alone with these observations. I can name a dozen New York physicians, some of whom have often performed tracheotomy, who can confirm the above statements from their own observations. Nor does the opinion of those differ who constantly perform intubation. I know that O'Dwyer, Dillon Brown, and Huber have come to the same conclusions, the latter having been a successful tracheotomist before he earned his laurels with intubation.

My experience in regard to the efficacy of the bichloride of mercury is mainly gathered in cases of laryngeal diphtheria, and a limited number of fibrinous bronchitis. It is there where it has been especially effective. Still I must not say that they were localized affections. These, with us, are but very scarce. Our cases of diphtheritic laryngitis are mostly decreasing, and complicated with either diphtheritic pharyngitis, or rhinitis, or both. Not a few, mainly of the latter kind, exhibit constitutional symptoms, sepsis. But cases of that kind also I have seen getting well. One of the most interesting was that of a little girl of seven years whom I saw a single time in consultation with Dr. J. Anderson. There was nasal and pharyngeal diphtheria, cervical adenitis, and some laryngeal stenosis. I recommended an hourly dose of one-fortieth of a grain of bichloride, which she took for ten days, also nasal injections of the same, one grain to a pint. They were made hourly for many days, and altogether continued for more than a fortnight, for the patient lived so long, and is still alive. She swallowed almost all the nasal injections, and great was my surprise when after some weeks I received the report of the case and learned that about twenty grains of the bichloride had found their way into the stomach of the little girl. She lived, had but little stomatitis, and hardly any intestinal irritation. If the case does not prove anything else, it proves this, that even desperate cases will get well; this case got well with the bichloride of mercury, and resembles all the other cases in this, that after the rational and careful administration of solutions of bichloride of mercury, local mercurial symptoms about gums, mouth, pharynx, and intestines, are extraordinarily rare in infancy and childhood.

ABDOMINAL DISEASE AND INSANITY.

BY E. C. SPITZKA, M.D.,
NEW YORK.

One of the chief problems with which the asylum physician has to deal is the regulation of the functions carried on by the abdominal viscera. The introduction and digestion of a sufficient amount of nutritious food, its proper assimilation and the eventual disposition of the *alvine residua*, are among the most constant objects of his care. It is not surprising that, recognizing the intimate relationship between abnormal mental states and gastric, hepatic and intestinal disturbances, the ancients should have fallen into the error of regarding the latter as a frequent primary cause. Down to the day of Schroeder Van der Kolk, eminent alienists sought in various indefinitely known nervous connections, existing between the viscera and the brain, the channels by which what they called "sympathetic insanity" was mediated. A reaction occurred; Griesinger rejected the older view, inflicting the sarcastic term "copro-psychiatry" on it. More modern authors have gone even further, and state that the cases of alleged insanity due to visceral disease will not bear critical examination. In a now historical discussion, which took place in the Medico-Psychological Society of Paris, the majority of the debaters took the position, that inasmuch as the most important

feature of the cases of alleged sympathetic insanity was a pre-existing disposition to nervous and mental disease, without which the visceral cause would probably have remained inoperative, it was not advisable to retain the term "sympathetic insanity" in our nomenclature.[1]

I am myself of the opinion that nothing is gained, and much lost, by designating a form of insanity by its cause. When an alienist shows me a patient and declares him to be a case of "gastric" or "rectal insanity," he has given me no valuable information regarding the clinical manifestations of the case. It were as just for a clinician to designate a case of bronchiectasis, with its accompaniments, as "stone-cutter's disease." But it is legitimate and useful for the alienist, after defining the clinical form he is dealing with, designating it, say, as a "hypochondriacal paranoia," or a "persecutional melancholia;" to add, "on a foundation of dyspepsia," or "intimately related to a rectal prolapsus."

Diseases of the gastro-intestinal tract, and the appended glands, bear a far more important part in the causation and modification of insanity than is usually admitted in text-books on the subject. The reaction against the view held by the ancients, though in the main practical and just, has overstepped the bounds of truth. When we find a man who is suffering from gastro-intestinal catarrh, manifest an irresistible tendency to malice and chicanery during the process of digestion, from which he is radically relieved by each alvine evacuation, we are led to suspect that the connection between the visceral disorder and the mental state is more than that of a mere coincidence. And when we discover in another patient who, already depressed by veritable causes of grief, contracts a gastric catarrh; and every time the burning feeling rises in her throat—and at no other time—indulges in the delusion that she is being burnt, we become inclined to admit that visceral disorders may excite a marked modifying influence on an existing mental disorder.

Lord Byron[2] stated it as his belief that body and mind are in indissoluble wedlock, for after a fit of indigestion he experienced a complete inertia of all his mental faculties. It is a notorious fact that dyspeptics are as pessimistic as sufferers from pulmonary trouble are optimistic. The dyspeptic indulges in a selfish interpretation, and according to his previous temperaments, he will, if this were choleric or sanguine, become quarrelsome, irritable and snappish; if it were lethargic, he will be inclined to somnolence; if it were melancholic, he will become melancholy or hypochondriacal. A marked disinclination to exertion is often noted particularly after meals, and in not a few cases, especially if gastric dilatation[3] be a complication, hallucinations and illusions are noted to occur either only after certain injuries or irritating ingesta, or at the acme of the digestive process.[4] The influence of stomach disturbance on the mind is too often underrated by practitioners of medicine. Not a year ago, a prominent medical practitioner of St. Louis committed suicide in consequence of spasmodic seizures due to hour-glass contraction of the stomach.[5] Probably no other single organ is responsible for so much subjective misery. There are patients in the practice of every physician who are as bright and cheerful on peptonized milk, as they are unhappy, wretched, and tired of life on fried potatoes and pork cutlets. Such patients soon become morbidly self-observant; the occurrence of a flatus, or an eructation, is anxiously noted; an easy evacuation is triumphantly extolled; a coated tongue plunges them in the deepest dejection. Add to this that the general nutrition may be suffering in consequence of the gastric disorder at this time, and the effect of this continual brooding may be anticipated. Many a testy hypochondriac has no other discoverable cause for his mental disorder than a protracted gastric catarrh. And his mental state is a veritable barometer of the better or worse condition of his stomach.

The extreme re-action against the views of the ancient writers occurred before the time when the grave, nervous consequences of abdominal disease were understood. Certainly, if Griesinger and his followers had borne in mind that apoplectiform vertigo may occur from a comparatively slight gastric disturbance, that speech difficulties may appear in dyspeptics, and at no other time than after meals, they would not have so arbitrarily designated that phase of alienism, when the visceral state was carefully studied, as "copro-psychiatry." As a rule the *ego* of the dyspeptic is not materially affected, the mental faculties are not impaired in form. But in a large proportion of cases there is an inability to exert the will powers, even to carry out so simple an act as the picking up

of an object that has fallen from the listless grasp. In a few cases of this kind the memory and speech are inhibited after meals. In others cutaneous hyperæsthesia develops, peculiar reflex symptoms, numbness of the hands (especially of the left), precordial oppression, and pain to the left of the fourth to seventh dorsal vertebræ are added, and the already melancholy patient develops all sorts of hypochondriacal fancies.

Recent observations tend to show that the liver, erroneously regarded as related to melancholia by the ancients, does exceptionally occupy an etiological relation to mental disorder. The philosopher de la Mettrie, [1] protégé of Frederick the Great, referred to such a case, in which the only lesion found after death [2] was an hepatic abscess. Hammond repeatedly aspirated the liver, and in some cases with remedial results—obscure abscesses, whose existence had not been determinable by any of the usual signs, having been the sole cause of a depressed mental state. He claims that vertigo, insomnia, transitory confusion of ideas, inability to concentrate thought without aggravating the symptoms mentioned, and great depression are the characteristic symptoms. Cyr has reported [3] a number of cases where attacks of hepatic colic were followed by a stupor which almost approached a coma in degree. He attributes this state on account of its intimate alliance with the attacks of colic and brief duration, rather to the effect of the painful state on the nervous system than to any toxic influence excited by the biliary ingredients in the circulation. That acute yellow atrophy of the liver is often accompanied by furious delirium, in which the patients strike and bite at the bystanders—a delirium of high intensity and remarkably brief duration—is a recognized fact of hepatic pathology. [4]

Diseases of the peritoneum are as exceptionally enumerated among the causes of mental disease. Thus, Bergmann [5] found a scirrhous degeneration of the epiploon in a case of stupor. A most remarkable case is published by Barrey. [6] The patient experienced repeated attacks of melancholic frenzy, and in the interval exhibited a passive melancholia marked by an intense expression of agony. Progressive wasting ensued, and the patient manifested a marked repugnance to covering of any kind, and threw off his clothing and the bed-covers, so that for months before his death he lay naked. Aside from vague complaints about his food, and desire to see his family, his only spontaneous utterances were demands for prolonged baths and that his abdomen be opened to remove some injurious substance there. The patient's feelings were clinically truer than the diagnosis of his physicians. He had the habit of bending forward and clasping his hands over the epigastrium, but repeated careful examination failed to show any special morbid condition. He died after a seven months' sojourn in the asylum. The peritoneum was found to be thickened and degenerated, agglutinating the various folds of the intestines, thus forming a common mass, everywhere permeated by a blackish-green liquid. Two large pouches filled with this fluid were found; the intestines showed advanced putrefactive change, but evidently the morbid process had antedated the asylum sojourn.

The rectum plays a very modest part in the etiology of insanity. The older writers assigned to hemorrhoidal diseases a very prominent rôle in the natural history of hypochondriacal and paralytic mental disorder. The presence of hemorrhoids in the insane is to-day regarded either as an accidental coincidence, or at most as a collateral feature of the "arthritic and herpetic diathesis" as Charpentier [7] recently designated it. In a few cases there seems to have been a direct relation between the mental state of melancholic patients and their rectal disease. One of my patients had for fifteen years suffered from so profound a degree of atony of the rectum, that she had frequently to resort to the disgusting procedure of removing the fæces *propriâ manû* when they were hard; when they were soft she suffered from active incontinence. During this time she has at various periods had fears of having Bright's disease, phthisis, etc. Finally, great depression developed, she became very irritable, and often whilst the noise of children playing annoyed her, an "inner feeling" urged her to commit suicide. On examination a marked prolapse of a rectal fold was found, and it was recorded that every exacerbation of her mental symptoms was preceded by an aggravation of the irritation connected with this prolapsus. She had considerable tym-

panites, was greatly annoyed by borborygmi, and experienced a burning feeling from head to foot, latterly accompanied by sharp pains in the limbs on such occasions. In a case of melancholia complicated by a rectocele, reported by Nolé[1], suicide was perpetrated. Each exacerbation of anxious melancholia was preceded by lumbo-sacral pain, which gradually rising in severity, at length caused the patient to cry out in despair and to beat her eyes with her hands. This condition of frenzy passed into one of morose taciturnity, in which she stared fixedly at the ceiling.

I have seen a number of cases, in which cardiac palpitations, spells of anxious terror and impulsions to suicide, followed by reactionary self-reproach and intermingled with morbid fears, were due to a conjoined dyspepsia and rectal trouble. In one such case there was abnormal narrowness of the rectum, and a radical cure followed the dilatation of both sphincters. In another, where the ingestion of hard meat infallibly provoked the attacks of terror, it was observed that very severe seizures were followed by a diarrhœa which the patient had come to regard as critical.[2] Kish[3] reports similar cases in which he determined arhythmy of the pulse during the spells of terror, and which he claims were relieved by the waters of Marienbad.

There is a peculiar condition observed chiefly in young girls about the period of puberty, which, whatever its original course, is intensified and modified by the state of the stomach. This state does not appear to be continuously pathological, for in cases in which death from starvation had ensued, that organ was found to be apparently normal. It seems to be rather a functional perversion. A patient of this class develops a slight dyspepsia and, rendered morbidly sensitive by the existing predisposition to nervous disease, usually present in their families, and doubly so by pubescence, she contracts a positive dislike for food. Improper food causes distress, the tonics, appetizing cordials and chalybeates with which a mistaken therapeusis drenches her, aggravate the trouble, and dislike is metamorphosed into a belief that food is injurious. All the patient's energies are devoted to the one end of resisting the introduction of food, and the morbid concentration on self ultimately leads to the development of a full-blown delusion that God has forbidden her to eat. Meanwhile the stomach, originally perhaps but very slightly diseased, ceases to present any signs of gastric catarrh; yet the patient does not resume eating, but goes on living for months and months on an occasional sip of water, tea or broth, and is visited by crowds of the marvel-loving majority as a so-called "fasting girl." The proper place for such a patient is the asylum, where the apparatus for forced feeding employed with readily assimilable food would soon overcome the starvation, and the delusion that led to it. The stomach-tube has performed even greater wonders, if we are to credit the claim of Schüle, that the recovery of a hypochondriacal paranoiac whose attacks of dyspepsia were relieved as soon as the œsophageal sound had passed a certain point where there was resistance, was due to artificial feeding.[4]

Much interest attaches to the influence of intestinal parasites on insanity. That these are competent to provoke a variety of nervous troubles, such as chorea, eclampsia and epilepsy, is well known; but that there are well established cases in which actual insanity ensued is ignored by the majority of recent writers. The rapid cure of the mental disorder following the expulsion of the parasites is the significant proof that the etiological assignment was correct. Acute, sudden explosions of mania, hyphochondriacal states, with or without eclampsia, are found in these cases. I have myself seen only the mildly hypochondriacal variety, and that with tapeworm. Rolland[5] relates the following convincing case of insanity: A man, aged thirty-eight, after becoming fatigued at his work, experienced an unusual malaise, confusion of ideas, writing and speaking at random, showing a profound change in physiognomy, his eyes being injected, and making aggressive attacks on his surroundings, of which he lost the remembrance. He vomited a large ascaris at the height of his disorder, and the relief was so rapid that an emetic was given him, and after the vomiting of two more he recovered entirely. As a rule, the mental disorders associated with worms, if of an acute type, are either complicated with convulsions, or, as in the case just related, they are of an epileptiform character. The intestinal parasites which have their habitat low down in

[1] *Journal des Connaissances Médico-Chirurgicales*, January, 1845.

[2] It is not impossible that in one of my cases a toxic influence had played a part in the etiology of the nervous and mental disturbance. The gastro-intestinal trouble dated from a fish-meal, which had been followed by vomiting, prostration and diarrhœa.

the bowel, notably the oxyuris, bear a less direct relation to insanity, where either by general irritation or by crawling into the genital passages of children, they provoke masturbation, and the latter habit leads to the development of insanity from self-abuse.

The clinical characteristics of insanity due to chronic disease of the digestive tract is depression. This depression has rarely the emotional depth of typical melancholia. To express myself coarsely, I would say, the true melancholiac is horrified at life; the dyspeptic melancholiac is disgusted with it. The true melancholiac is so intensely unhappy that he cannot muster up courage enough to hope for relief; the dyspeptic melancholiac is but too ready to try every new remedy or doctor—alas, too seldom willing to follow rational and necessary dietetic directions. Another characteristic feature of the mental disturbance due to visceral disease, is its rapid change in such remarkable parallelism with the somatic state. The patient who feels comparatively cheerful up to eleven in the morning, becomes snappish, ugly and irritable as he awaits the hour of the noonday meal. While eating, his cheerful condition returns; but at a period varying from a few minutes to an hour after meals he again becomes wretched, confused, incapable of exertion, desperate, anxious, filled with morbid fears and evil forebodings. Imperative conceptions and *folie du doute*, are often found; but they are probably due to nervous prostration brought on by the coexisting insomnia. This condition reaches its height between two and three hours after meals, to entirely subside with the next visit to the closet. Where the peritoneum is affected, and in relation with insanity, the pinched, painful expression of the countenance has been remarked, while with intestinal parasites the dilatation of the pupils, peculiar pallor and aggravation of the symptoms coincidently with or after borborygmi, direct attention to the source of the trouble.

The various diseased conditions above referred to stand in a direct causal relation to insanity in but a small proportion of cases. More frequently their presence modifies special symptoms developed in those insane from other causes. Thus it has been noted that gastro-intestinal disease occurring in a depressed lunatic is very likely to determine the delusion of being poisoned, and thus lead to refusal of food and voluntary starvation. Hepatic disease aggravates, if it does not provoke depression. Cancerous disease in delusional lunatics sometimes determines the illusion that there is a wild beast in the stomach. The influence of intestinal stricture, of epiploic bands and peritoneal adhesions in modifying the superficial expression of insane beliefs is notorious. One such patient under the author's observation claimed that he had a "doctor in his belly." Esquirol relates the case of one who asserted he had a whole council of popes and all the personages of the New Testament in the same cavity. The study of such symptoms is, however, more interesting than profitable, for they do not expose any essential relation between cause and effect, but merely an accidental feature of disease. The lunatic who, because he feels flatus move from coil to coil of his gut, struggling to pass constricted or agglutinated segments of the same, believes that there is a living thing within him, suffers from a lack of observing and reasoning power, which, in the absence of the visceral disorder, would cause him to base an equally absurd delusion on the observation of some outside occurrence. The operation of visceral disease in the production of mental disease in persons of previously sound mental health and sound antecedents is extremely limited, if not nearly *nil.* But it plays an important rôle as an exciting cause in many of our neurasthenic and hereditarily predisposed patients. Proper attention to the somatic disturbance is often therefore attended by results which strike the patient as magical. The relief of a gastric catarrh causes the disappearance of anxious terrors; of a constipation, of morbid fears; the expulsion of worms, of a distressing convulsive or maniacal disorder.

SMALL DOSES; THERAPEUTIC CONSIDERATIONS.

BY JOHN AULDE, M.D.,

DEMONSTRATOR OF PHYSICAL DIAGNOSIS IN THE MEDICO-CHIRURGICAL COLLEGE OF PHILADELPHIA.

The short paper on "Small Doses," recently published in this journal, having met with a flattering reception, not only in this country but abroad, I have thought it advisable to continue the discussion by the presentation of some further therapeutic considerations. My object in so doing will be appreciated by a reference to the various views which have been advanced as to the *modus operandi* by which the therapeutic results of small doses are obtained. To illustrate: It is claimed by some that these small doses are potent remedies by reason of their frequent repetition; by others, that the method of

preparation, long continued trituration or succussion, and consequently thorough subdivision, accounts for their efficiency. Again, it is argued that small doses act by substitution—a theory which in itself is rather contradictory. Some who practice this method empirically would have us believe that no reason is needed further than the established fact of their almost universal success, while the homœopathic fraternity asserts that we are trenching on their domain; and last, but not least, the dosimetrists say that it is simply an attempt to reduce the practice of the healing art to a system of mathematical exactness, a work in which they have been enthusiastically engaged for the past fifteen or twenty years. A systematic review of these claims need not be undertaken here, as the intelligent and conscientious physician will have none of them, except that he will prescribe empirically remedies which he knows or believes will be instrumental in relieving suffering and curing disease. Better reasons, however, than either of the foregoing must be advanced before the majority of the profession will show a willingness to discard polypharmacy; and no doubt these will be forthcoming, but the inventor must be prepared to run the gauntlet of adverse criticism.

What I have to say at present will be confined chiefly to the therapeutic action and effects of small doses, referring incidentally to the physiological action in so far as the physiological effects point to the therapy, bearing in mind meanwhile that the physiological action of a remedy is modified by diseased conditions. Thus, in the use of electricity, it is well known that disease has the effect of reversing or transposing the physiological order of manifestations, as illustrated in the reactions of degeneration. Again, nitroglycerine is classed as a paralyzer, and we are taught that it may be given with advantage when it is desired to paralyze the vasomotor system: a fallacy which requires no further investigation than a reference to the cases in which it has been used to restore apparently moribund patients to life, as in the case of opium narcosis, asthma and other conditions which need not be mentioned. The actual results are not in accordance with theory, and the deductions of experimental physiologists fall to the ground. It has been said that, "The most effective way to explode a popular fallacy is to explain it," and nitroglycerine and electricity appear to offer special inducements. Macaulay is accredited with the observation that, "As the world gains in exact knowledge it must lose in imagination; the moonlight of fancy giving way to the sunlight of fact, and the creative faculty yielding place to the spirit of investigation or criticism."

Physiology, like politics, makes strange bed-fellows. Strychnine, said to be a stimulant to the nervous system, is in reality, not a stimulant at all, and we are taught that in the case of the ingestion of a lethal dose of this so-called stimulant, with the appearance of tetanic spasm, that its congener, electricity, another pseudo-stimulant is barred, as although the spasms are overcome, the patient dies. Under the same conditions, section of the spinal column overcomes the tetanic rigidity, but the unfortunate sufferer is as effectually paralyzed as when electricity is used. On the other hand, nitroglycerine, which in some respects acts in an opposite way to that of strychnine, stimulating the entire vascular system, and even raising the dead, to all intents and purposes, is classed as a paralyzer. Electricity, which is daily reaping its victims in connection with electric lighting, now known to be a potent remedy in extra-uterine pregnancy, and acknowledged even in small medicinal doses to act as a paralyzer when long continued, has long been regarded as a stimulant, and such is its present position. As a correlator of nerve-force it kills, a paradox difficult to understand.

In defence of the tenets held regarding electricity and strychnine, it may be suggested that the action of these remedies in small or medicinal doses is different from the action when large doses are used, a claim which would endow them with an unusual degree of fugaciousness, wholly unsupported by the facts. The truth seems to lie in the direction of limiting the physiological action of a remedy to one positive and distinct line of manifestations in health, the effect being modified by an increase or diminution of the dose, or by "the inter-action of the different parts of the body on one another" (Brunton). In disease, the action of the remedy will depend upon the pathological conditions present, and the tissues or organs affected may be acted upon in a manner similar to the physiological action in health; or the reverse may be true. Thus, Ringer says: "Strychnine affects paralyzed sooner than unparalyzed muscles;" but the fact is that strychnine does not affect the muscle in the least directly. The muscles supplied by enfeebled nerves are the ones first to show twitchings and spasm from both strychnine and the electric current, and were these agents true correlators of nerve-force it is only reasonable to suppose that their stimu-

lating action would first be observed in muscles supplied by healthy nerves. Let this serve as food for thought, a subject for investigation or criticism, and possibly the fallacy may be exploded by explaining it.

Were I disposed to enter upon an investigation of the physiological action of drugs, no better text could be found than the general principles laid down by Brunton, as indicated by the following catch-words: The interaction of various functions, direct and indirect action, local and remote action, relation of effect to quantity of the drug, dose and mode of administration, cumulative action, the preparation—pills, powders or liquids, effects of fasting, habit, temperature, season, climate, and time of day. Dr. Brunton also says (page 37), "The attempt to ascertain the precise mode of action of a drug by its *simple* administration, either to a healthy man, or to healthy animals, and observations upon them, is hopeless." Our great object, then, in the practice of the healing art, is to determine the uses and value of remedies as applied in the treatment of disease: clinical therapeutics. The secret of successful therapeutics is in knowing the effect of drug action in disease, and in understanding the demands of the economy in the case of complications.

This brings me to the question in hand: Can the use of small doses be explained upon any reasonable basis in accordance with modern physiological laws, with pathological changes as a factor to be taken into consideration; or shall the method be condemned as on a par with the late sensational announcement of M. Luys, concerning the alleged action of "*Médecines à distance?*" The readers of this journal are no doubt familiar with the conclusions of the commission appointed by the Academy of Medicine of Paris to investigate the truth of the report, and it is to be hoped that my views, although novel, yet not altogether new, may prove more substantial than those of the fanciful Frenchman.

The following extract from a clinical lecture on "Lithæmia with grave nervous symptoms" (Reporter, May 5, 1888, page 573), has been re-arranged and slightly modified to indicate the direction taken in the course of my investigations. The words in italics are my own; those enclosed in parentheses form a portion of the lecture as it originally appeared. While the changes are but slight, and do not fully elucidate my theory, there is a marked difference as to the assumed pathological conditions and the train of circumstances leading up to the ultimate objective symptoms. The case under consideration is that of a patient suffering from right-sided convulsive seizures—consciousness being unimpaired—denominated "hemi-spasm."

"Their occurrence *may be* (is) ascribed to the irradiation of powerful *occult influences* (motor impulses) proceeding from nervous centres, which are kept in an almost constant state of irritation and excitement by the morbid condition of the blood which *fails to nourish* (nourishes) them. From time to time there occur periods when defective coördination between the great abdominal viscera, the kidneys, liver and stomach, is followed by serious vitiation of the blood. The processes of secretion and excretion are interfered with or temporarily suspended, and the blood becomes loaded with effete products which, when in sufficient quantity, quickly manifest their power of exerting an actively poisonous influence, *destroying nerve-function.* The nervous centres, bathed in this toxic fluid, become intensely irritated; they become even more morbidly sensitive than usual, until finally, when nervous *control is suspended,* (tension has reached a point beyond which it cannot go,) there is a sudden explosion of force manifesting itself in these violent muscular contractions. At such moments, comparatively slight causes are sufficient to overthrow all *controlling* (inhibitory) influence, and give free reign to these irregular exhibitions of *muscular* energy. In this particular case these phenomena are brought out with exceptional clearness."

Having these observations before us, let me now proceed to examine the action and the effects of the three remedies already mentioned.

Nitroglycerine.—In the previous paper the types made me say this remedy in drop doses every five or ten minutes might be given for the relief of certain kinds of headache. Of course, the one per cent. solution was the preparation referred to, instead of the pure article. Exception has been taken to this recommendation on the score of its not coming within the category of small doses, and to a certain extent this is true. A few words of explanation, however, will serve to set the matter in its proper light. Five years ago a gentleman over sixty consulted me for a headache which had persisted for several weeks, although constantly under treatment. He was ordered to take that evening before retiring one drop of the one per cent. solution, in water, every five minutes, until six doses had been taken. He did this, and the result was that he felt all right the next morning, although later in the day the same symptoms showed a disposition to

return. Accordingly, the medicine was repeated the following evening, with perfect and permanent relief. Some years ago a medical friend related to me his experience in a similar case. The patient was a young man, and was put under treatment in the office one afternoon. In the course of an hour and a half fifteen drops of the one per cent. solution were administered, when the patient experienced a sensation as if something in his head had cracked, causing a loud report. The headache had vanished, and no bad effects or unpleasant sensations remained. Last autumn I saw a gentleman with phthisis pulmonalis, who had not slept an hour, night or day, for twelve weeks, on account of cough and irritable condition of the throat. From eight o'clock in the evening to ten, he took eight drops of the one per cent. solution, and slept comfortably all night, except that he was awake several times; but there was no troublesome cough. Instead of rising at daylight, as was his custom, he lay abed that morning until nearly nine o'clock. He spent a very comfortable day, and has not had any serious trouble with the throat since. This occurred last November, and the year preceding that time he had been under the care of four different physicians who had signally failed to relieve him. Large doses, five drops every three hours, are recommended by Dr. W. John Harris (*Therap. Gaz.*, May 15, 1888) in tubal nephritis with fever, dropsical effusion, and albuminous urine with tube casts.

Small doses of nitroglycerine may be given with great benefit in the case of embarrassment of the respiration and cough accompanied by a feeling of constriction about the throat in acute and chronic catarrhal affections (bronchial), in catarrhal pnemoniua and in catarrhal phthisis, either with or without profuse expectoration. Two, four or six drops of the one per cent. solution should be added to four ounces of water and a teaspoonful taken every two hours. An elderly woman suffering from catarrhal pneumonia of long standing, accompanied by constant hacking cough said, the day following the use of this solution, that she thought she had a new throat, so great was the relief. It will be observed that the dose here is 1-1600, 1-800 and 1-500 drop respectively, quite small enough to satisfy the most exacting.

An interesting case occurred to me a few months ago. The patient, a laboring man, or superintendent in a factory, had been suffering for more than a year from pain and stiffness in the muscles of the back of the neck, along with an unpleasant sensation in the occipital region. He said the pain in the head felt as if some one had taken hold of the brain and was twisting it around. His trouble was for the most part constant, as bad in the morning as at night, and was not influenced by taking food. After this long siege, and having gained no relief from the ministrations of several physicians, whose directions he had religiously complied with, he came to me. One drop of a one per cent. solution of nitroglycerine three times daily caused the pain to vanish in two days, and at the end of a week the medicine was discontinued. I should add that for the first few days the medicine affected him rather unpleasantly for the period of half an hour after each dose. Several weeks later this gentleman took a bad cold, which caused a return of the head trouble to some extent; but it was of short duration and was fully relieved by half-drop doses three times a day.

Now, assuming that pain is an expression of impeded and imperfect nerve energy, rather than of heightened nerve function, this remedy acts as a vaso-motor stimulant, increasing the supply of blood to the affected nerves, and by this simple means extinguishing their hungry cry (Valleix). In the case of lithæmia cited, we have seen how the sensibility of the nervous system may be obtunded to such an extent as to cause violent muscular contractions. At other times this abnormal condition may manifest itself in the shape of pain. How often do we witness subsultus in low fevers, twitching of the muscles, rambling and delirium, all due to depression of the nervous system, relieved by suitable pabulum in the shape of stimulants, or held in abeyance by calmative hypnotics or anodynes. These observations clearly point to the corectness of the theory that the function of nerve-force is not to stimulate, but to restrain and control muscular activity, a matter which will be more comprehensible when we consider the uses of electricity and strychnine.

[TO BE CONTINUED.]

AMENORRHŒA AND ITS TREATMENT.

BY WILLIAM B. De WEES, M.A., M.D.,
SALINA, KANSAS.

The absence of the menstrual flow in a woman in whom it should naturally exist constitutes the symptom known as amenorrhœa. This term is, however, also applied to designate the absence of the catemenia for a considerable time after the regular

monthly epoch, in a woman who previously menstruated regularly. Thus we have, technically speaking, two great varieties of amenorrhœa, as commonly reckoned: (1) emensio mensium—when there is complete absence of anything like menstruation for a long period after the usual time for its appearance; (2) suppressio mensium—when the catamenia are obstructed in their regular periods of recurrence, in a woman in whom menstruation has been established.

Amenorrhœa is not a disease, but a symptom of a great many abnormal conditions of the system, the chief of which is chlorosis. This chlorotic state, as the fundamental cause of amenorrhœa, is of great frequency among women who live luxurious and indolent lives, and in this way disorder the nervous system and the circulation. Hence we encounter it for the most part among women in the higher and more wealthy classes of civilized society. Chlorosis is to be easily recognized by the whitish-green hue of the skin of the patient, the absence of a red color in the lips and mucous surfaces, the presence of languor, listlessness, depraved appetite and impaired digestion, constipation, palpitation, etc. There are also other symptoms and physical signs of serious systemic disturbances, among which may be mentioned a bellow's sound, heard almost invariably over the heart. This murmur is continuous in the larger arteries, especially the carotids and subclavians, and is reinforced by each systole of the ventricle. This sound is very similar to the *bruit* coincident with enfeebled circulation, as after copious hemorrhage. The blood when drawn from a vein is thin, light-colored and deficient in red corpuscles and in iron, while the clot is less proportioned than in health, etc.

The best method of treating amenorrhœa (emensio-mensium) is a very important matter. The true physician, having for his highest ambition "to aid nature," when called upon to treat amenorrhœa, must keep in view the cardinal points of his compass. He must keep in view first and foremost the three elements which must exist in a perfect state of health for the normal performance of the function of menstruation, viz.: 1. The ovaries, uterus and vagina must be normal in form and vigor. 2. The nervous system governing the relations between these organs must be perfectly healthy. 3. The blood must be in its natural healthful state, both in quantity and quality.

It will thus be seen that amenorrhœa is the symptom of a disordered state of one or more of these three elements, regardless of what the varied and numerous causes producing this disordered state may be; and that to successfully treat such cases, it of necessity requires the removal of the causes producing the disordered state, and in the next place to aid nature in restoring lost function.

The very first step, then, in the treatment of these cases is to be satisfied by a thorough examination as to the condition of the organs involved. Being satisfied in this particular, the second and third elements are to be studied simultaneously, since whatever benefits and improves or invigorates one effects the other proportionately. Thus we may first place at the top of our programme good, wholesome, nourishing and easily digestible and assimilable food. Milk, fresh beef, bran bread, eggs and fruits must form the greater portion of the dietary. Next in the order of importance are hygienic influences in the strictest sense of the term. The patient should pass as much time out of doors in the fresh air and sun-shine as possible. The danger is in the house, and not out of it. Regular and systematic bathing followed by a thorough rubbing—sea-bathing is preferable; exercise of any and all descriptions on foot, on horse-back, by rowing, calisthenics, etc., the association of cheerful and pleasant society, change of scenery and climate, overland route or sea-voyage, etc., and last but not least, early retiring to bed in the evening (9 o'clock) and early rising in the morning (5 o'clock). These principles strictly carried into execution would in the large majority of cases probably prove all that would be necessary to aid nature in making full restoration.

But do what we may, it is impossible to secure harmonious action on the part of these patients as a class, in executing the instructions fully; hence we are forced to resort to medication as an adjuvant or auxiliary to the treatment. Just here is where a large portion of the practitioners are forced to hesitate, as to the better remedies or combination of medicines to be prescribed. In this connection I beg leave to say that I have treated no less than several hundred cases of amenorrhœa, of the two varieties above defined, and while I founded the management of all my cases upon the foregoing general and fundamental principles of treatment, I have used in addition, in a large portion of my cases, the following medication, and am unable to recall a single case in my experience in which the treatment was not crowned with success. I first prescribe:

℞ Liquor ferri et quininæ citratis .....f℥j
Liquor potassii arsenitis.....f℥iij
Atropinæ,
Strychninæ.....āā..gr. ss
Elixir aurantii q.s. ad.....f℥viij

M. Sig.—Teaspoonful in water, before meals, three times daily. The ingredients or dose to be increased according to the tolerance of the patient.

This is continued in cases of emensiomensium, until there is manifested the peculiar menstrual malaise, or some slight show, when I discontinue it and prescribe:

℞ Potassii permanganat..... .....gr. x
Ft. pil. No. x, compressed or in capsule.

Sig.—One pill followed by one-half glassful of water before meals, three times daily.

Also:

℞ Manganesii bin-oxidi.....gr. x
Ft. pil. No. x, compressed or in capsules.

Sig.—One pill after each meal, three times daily.

By the second or at most the third day after taking these, the flow usually becomes fully established. If the manganese does not fully effect this at the first attempt, we have, however, a stated period from which calculation can safely be made for the next period. The first prescription is relied on during the interval, and the pills commenced about three days before to the expected time.

In cases of supressio mensium, I usually simply rely on the permanganate of potash and bin-oxide of maganese as just stated, and have found the combined use of these two salts all that can be desired for an emmenagogue. The first is a direct emmenagogue, stimulating the uterine muscular fibre; and the latter is an indirect emmenagoge, improving the blood and toning up the nervous system. I have in a number of cases of strong, robust and large women, used these salts in two grain doses. In two patients, who were women of culture and refinement, wealth and influence, I was repeatedly assured by them that they were positive of no conception having taken place, but after three days use of the drug in one case, and four days in the other, I was in both cases hurriedly summoned. I found them in a high state of fever, 102° and 103° respectively, with quick pulse, emesis, spasmodic and painful contractions of the uterus, diarrhœa with some tenesmus, frequent micturition with attendant strangury, a flushed and hot surface of the entire body—indeed the skin in the face assuming an erysipelatous blush. The conjunctiva was congested, the pupils somewhat dilated. I gave a hypodermic injection of morphia to allay the irritation, which it gradually accomplished, and the alarming symptoms subsided, with the exception of the uterine contractions; these continued, but with comparatively little pain until the following night, and then finally ceased after bringing away a two months embryo in the one case, and a three months embryo in the other case. The drugs had been administered three days in the first and four days in the second case, in doses of two grains each. The period of gestation was afterward fully acknowledged by each mother respectively, who also confessed that they had designedly concealed their pregnancy with the purpose of obtaining a miscarriage. This result must be attributable to one of two things: Either it was due to an untoward effect or physiological action of these drugs. Idiosyncrasy is out of the question, since both these women had been treated before with permanganate of potassium, and other drugs separately, by several physicians with no effect whatever. Or, on the other hand, there must be an action resulting from the combined administration of these two drugs, which produces a peculiar or more powerful effect, than either of them does when administered alone. For in these two cases they proved true ebolics, for I have never witnessed such a peculiar and powerful oxytocic action from ergot or any drug, and it persisted even after morphine had been duly administered.

PREPARATION OF MILK IN SUMMER.

BY E. A. WOOD, M. D.,
PITTSBURGH, PA.

The time is here for the summer complaints of childhood. Thousands of children were lost last year—shall the Angel of Death again cast his annual shadow over our homes? Have we learned anything since last year, and are we more competent than ever to stay the slaughter of innocents—the slaughtering that is a disgrace and a crime? Do we know of even one thing, trifling though it be, that shall assist in carrying children through the perils of the heated term now on us? That others may be encouraged to publish the facts and opinions in their possession bearing on the subject, I offer one small suggestion on the subject of infant feeding.

When human breast milk cannot be had in any case, procure the best cow's milk; get it fresh morning and evening; keep it in a cooler in which nothing else but ice is kept; keep that cooler out of doors in the shade, or in an open hall or room, and not in a closet, pantry or cellar. Take one pint of milk and divide it in two equal parts;

separate the curd from one-half, either by heat or by heat and calf's rennet—the latter preferably, because it not only more quickly separates the whey and the curd, but rennet is a real digester, and better than any artificial pepsin. Take the whey so separated, add it to the other half of the pint of milk, and feed as the child needs.

Several modifications will suggest themselves to the intelligent practitioner. Those who have faith in *pepsina porci* may use it to partially digest the whey milk. When this is done, the whey milk should be boiled to stop complete digestion. My experience is that fresh milk from grass-fed cows is more easy of digestion without being boiled. When the milk is not of that kind, and to destroy bacteria, it is perhaps better to boil it. The thing I wish to bring to notice is that weak stomachs can digest milk containing *half* its curd, but cannot digest all the curd. Life is too short to spend in arguing the advantages of whey over water as the diluent of milk. Those who cannot feel the force of such a procedure should continue to use water to dilute cow's milk. Milk whey has gone out of fashion, but whey will come in again, not as a fashion, but as food commending itself on principle and practice.

Milk whey is a much better fluid than water to add to the many preparations of beef in the market. Try it.

Every practicing physician should have a small food laboratory at his home, where he can experiment, and learn for himself the behavior of foods, and how to modify them for the requirements of his patients.

Society Reports.

PHILADELPHIA COUNTY MEDICAL SOCIETY.

Stated Meeting, May 23, 1888.

Therapeutics of Diphtheria.

In opening the discussion on Dr. Jacobi's paper (see pages 797, 829), and on Dr. O'Dwyers (see page 806),

Dr. William Pepper said: The evening has been so well occupied in listening to the two important and unusual papers—to me most instructive—that there remains little to say in the way of discussion, save as to courteous appreciation of the kindness of our visitors and of our debt to them. I rise, then, simply to express our appreciation of the great wisdom of the advice to which we have listened. In regard to the last paper, I wish to add my mite of evidence to the value of the operation introduced by Dr. O'Dwyer. It is destined to fill an important place for these reasons, if for no others: that you can induce parents to assent to intubation, when it is impossible to secure their assent to tracheotomy; that in very young children in whom, as we know, tracheotomy is so difficult an operation, intubation can be performed with great facility; and finally, in septic cases, here is an operation for restoration of breathing space by means of an artificial air-tube which does not involve an abrasion of the surface to tempt extension of the infectious process.

From the masterly address of Dr. Jacobi, I am sure that every person present has derived much instruction and much pleasure—stamped, as it has been from beginning to end, with the accents of earnest truth, with the richness of practical experience. It is precisely these details to which Dr. Jacobi has called attention, that are of the highest importance in the issue of our cases. If he had done nothing more than warn us of the danger of relying too implicity upon trained nurses, he would have done a service. As with every new instrument of precision, after its value has been demonstrated, comes a period in which there is a dangerous tendency to rely upon it too exclusively; so with trained nurses, if we trust too implicity to their unsupervised discretion, we are consigning our patient to more vigorous, and, therefore, more dangerous ministrations—because equally unskilled—than the untrained solicitude of parents and friends. And this must continue to be the case until a longer and more thorough course of study is insisted upon. So, too, with the high importance of a radical treatment of antecedent and neglected—because apparently trifling—lesions, which the lecturer has emphasized. It is well for us to bear in mind the warning that tonsillar hypertrophies, nasal catarrhs, and the like may tempt the localization of diphtheria, and I may add of scarlatina and of measles in time of epidemic.

The extreme value of iodoform in local treatment I can confirm. Soluble in ether, miscible with glycerine and with oils, capable of use as powder, it is the best of all local applications, and may be applied to all cases and conditions. I would, however, interpose a mild protest against the too sweeping condemnation of the steam atomizer. Used with that gentleness, so wisely insisted upon, and the confidence of the child obtained, the relief to oppression is so soon recognized that we can secure intelli-

gent coöperation in its frequent and regular use. The problem of internal treatment is the most difficult one, a problem which largely and continually occupies our thoughts. I have been glad to hear Dr. Jacobi's clear and outspoken adherence to the mercurial treatment, although he limits it to a certain group of cases. My longer experience has but abundantly confirmed my early impressions of its value—preëminently in laryngeal diphtheria whether primary or descending; and I am constantly impressed with the tolerance of children to the bichloride, and equally to the mild chloride. But I would go further than the lecturer. If in a form conspicuous as a dangerous one, which is usually not primary, but associated with rhinitis and faucitis, this treatment proves efficacious, why is it not equally good where the nasal or faucial disease has not extended into the larynx? I have found cases of nasal diphtheria which were a source of great anxiety yield in a most remarkable way, and it has seemed to prevent the local spread as well as septic infection.

I agree with Dr. Jacobi that it is well to begin treatment with the chloride of iron, and that the association of chlorate of potassium is a matter of comparative indifference, and that large doses should be given at short intervals. But I have not been so fortunate in seeing it usually well borne by the stomach. When gastric or intestinal irritation manifests itself, it is well to stop the iron abruptly and to substitute mercurials. Or, when in the beginning of a case the glandular involvement, the faucial tumefaction, the constitutional symptoms, give evidence of rapid sepsis, we cannot depend upon iron and must give the corrosive or the mild mercurial chloride at once.

In an address covering so wide a field there is much room for difference of individual experience. In threatened heart failure, I would appeal for the early administration of strychnine, which I place above digitalis or sparteine or ammonia, above everything but alcohol. These are but slight observations on a subject opened with a breadth and discussed with a richness for which we cannot sufficiently express our admiration.

Dr. Carl Seiler: I have only to say that in my experience the addition of chlorate of potassium to the chloride of iron has been of great use, although I agree with Dr. Jacobi that chlorate of potash alone is of little use. From laboratory experiments I attribute this to the disengagement of chlorine gas when the two solutions are mixed.

I see that Dr. O'Dwyer has added an artificial epiglottis to the tube. It has been the experience of all laryngologists to meet with cases of complete or almost complete destruction of the epiglottis by syphilitic or other ulceration, in which there has been no difficulty of deglutition at all. Therefore I long ago came to the conclusion that it is not the epiglottis which protects the larynx, but the apposition of the ventricular bands. And I would suggest, though I have no experience with such a device, that if the tubes were so made that the head could slip into the ventricles of Morgagni without interfering with the ventricular bands, there would be no difficulty in deglutition experienced. It is not only in New York, but also in this city, that the only operation for opening up the air passages that parents will consent to, is intubation. I recall a very distressing case in an asylum, in which the matron would not consent to tracheotomy until the mother of the child had been communicated with, and while they were hunting the mother the child choked to death. This was before we knew of intubation. That we might have performed at once.

Dr. H. R. Wharton: The hour being so late I must postpone what I had intended to say concerning some of the complications of intubation. As to the calibre of the tubes, the fact that children do breathe well with tubes as now made, is sufficient evidence of the correctness of Dr. O'Dwyer's position. Since my experience of this, I am not so anxious as formerly to get in the largest tracheotomy tubes.

Dr. E. E. Montgomery: Since August, 1886, I have performed some thirty or forty intubations, having previously done some twenty-eight tracheotomies. Fifty per cent. of the children intubated have recovered. My experience is that this operation largely reduces the necessity for tracheotomy, and I believe that if intubation were done early in every case, tracheotomy would rarely be necessary. I cannot refrain from saying that I feel that in devising and perfecting his operation, Dr. O'Dwyer has been a benefactor to the medical profession and to the human race.

Dr. M. Price: In the evolution of steam from lime I have for the last fifteen years depended upon the same method as country people use in the scalding of hogs. Put a few pieces of lime in a bucket with hot water, place a blanket over the bed and let steam pass over the child's head. Soon the child acquires confidence and asks for relief, and will even bend his head down over the

bucket trying to get the vapor into his throat. Now, if every half hour a hot stone or brick or piece of metal be added to the water, it will keep up the heat without any stove or fire being needed in the room. It keeps the room clean and the atmosphere sweet. I have not found so much danger of contagion when lime is used.

I show here a specimen of tincture of chloride of iron in syrup, which is well made and of the proper color. There are very few drug stores in which you can get it properly made, and if you don't get the right thing it is of no service whatever. Its greatest good is in its local effect.

Dr. Shimwell: I have performed intubation sixteen times with seven recoveries. In all there has been immediate relief to respiration. In one case I had to remove the tube twice, and introduce it three times, and perform artificial respiration. In removing the tube post-mortem, I have found it impossible to drag it down through the trachea, so there is no danger of slipping. Is not the occurrence of substernal respiration-depression rather too late an indication to wait for?

The President, Dr. J. Solis-Cohen: I have listened with pleasure and with profit to both these papers; and with all the study that I have given to this subjeet, I have gained information to-night on many points. The advice to give early attention to the heart, that when danger already threatens it may be too late to effect anything with remedies, is advice that we should all take to heart. We have been distinctly taught that the prevention of this complication must be from the beginning an integral part of the treatment.

In regard to local treatment my experience has differed from that of our distinguished guest. Where it can be properly applied to the extreme margins of the pseudo-membrane I have found that the topical use of chloride of iron, by firm and gentle pressure with brush, or, preferably, cotton wad, the most serviceable agent I have used. The drug has an astringent and a disinfectant action, and I am satisfied that I have time and again seen it assist the detachment of false membrane, and apparently prevent the extension of the infection. Concerning the value of chloride of iron internally, the importance of large and frequent doses, the advantage of mixture with glycerine to assist its local effect, I can only confirm what has been said. So, too, as to the bichloride of mercury; I am glad to hear its great usefulness emphasized, and, with Dr. Pepper, I would include all forms of the disease in the field of that usefulness. Empirical observation has long taught us the preëminent value of the chlorine compounds in general in the treatment of diphtheria; and the mercury chlorides, more particularly calomel, however, have always enjoyed a high reputation in the internal treatment of membranous laryngitis. It has pleased me, in these discussions, to hear reasons at least plausibly advanced in explanation of facts which our forefathers learned and used empirically; this is the true direction of medical progress. The topical action of steam is very important. It has always seemed to me that in the natural course of the disease the membrane is thrown off by an accumulation of fluid beneath it which softens it and secures its detachment. We aim, then, by furnishing artificial moisture, to imitate the natural process of recovery. And this leads me to speak of the value of the vapors from lime in the process of slaking. Using a large wash-tub or wash-boiler, and keeping up a supply of large pieces of lime, we secure an abundant disengagement of the hot vapor of water, carrying up with it particles of lime, which mechanically assist by prying up the edges of the pseudo-membrane, and thus favoring the access of the vapor of water beneath it.

There is another method of local treatment which I employed with great satisfaction, more especially in former years, when I saw more of the disease—that is, inhalation of carbolic acid in the spray of a steam atomizer, in very large doses. Twenty to twenty-five grains would be added to the ounce of water, and from half an ounce to an ounce sprayed into the throat every hour, or even half hour, until commencing discoloration of the urine gave evidence of saturation, when the remedy was to be stopped until the urine again became clear. Under this method I would advise the attending physician to see the child four or five times a day, always having the urine last voided saved for him, and when the olive discoloration is noticed to intermit the carbolic acid. This seemed to me to disinfect the system, and thereby improve the local condition, and, at the same time, to prevent or diminish the danger of systemic sepsis. I was not aware, before to-night, that such small doses of carbolic acid as Dr. Jacobi mentions, could be of service.

I must repeat our sincere appreciation of the obligation under which Dr. Jacobi has laid us by his masterly paper. I am also glad to thank Dr. O'Dwyer for his lucid exposition founded on fact, and proved by actual exhibition of specimens, that the small calibre of his intubation tube is amply sufficient for due respiration. My own experience

with tracheotomy has led me to favor large tubes, the largest that can be introduced without touching the walls of the trachea. I still believe that I have seen life saved by taking out small tubes and substituting larger ones. And I confess that the small calibre of the tube used was one of the theoretical considerations which I enumerated among the drawbacks to intubation. But facts are stronger than theories, and as the small calibre intubation tube does seem to give air enough, and as enough is all that is wanted, I am ready to profess my satisfaction with its present calibre.

I must ask Dr. O'Dwyer to make clear to us the question as to the impaction of membrane. This is not a mere theoretical objection, but is borne out by experience. Perhaps I have been led to attach an undue importance to the matter by an accident which occurred to me a year or so before Dr. O'Dwyer read his now historical paper before the International Medical Congress at London, in 1881. I had been called to a case of membranous laryngitis, and had proposed tracheotomy, which had been declined. As I turned to leave the room the mother called piteously, "Oh, doctor, don't leave my child without trying to do something for it." I said to my assistant, "we will try to save this child," and taking a catheter I cut off the end, and passed the instrument into the larynx. The child instantly became black in the face, and there was nothing for it but, without asking any questions, to plunge my knife into the trachea as the child lay on its mother's lap. I inserted the same catheter through the orifice deep into the trachea, and then we performed artificial respiration; my assistant inflating the child's lungs through the tube with his own breath, and my hands exercising compression of the thorax in respiratory rhythm; and, after a while, we had the satisfaction of leaving the rescued child sleeping peacefully with unobstructed respiration. But I confess that this experience cost me some of the most anxious moments of my life, and has left a fear of the danger of crowding down membrane in front of a tube introduced into the larynx, which may, perhaps, make me overanxious.

Dr. Jacobi, in closing the discussion on his paper, said: The slaking of lime has the further advantage that it is the only way to utilize lime. A lime-water spray is useless, but in slaking, a large amount is carried up into the air and air-passages.

The suggestion of the President, that carbolic acid should be used in spray until discoloration of the urine is noticed, I do not feel inclined to adopt. Diphtheria is the very disease in which no complication should be allowed to exist, and we must not tempt them. A single case in which we should have to blame ourselves for a possible nephritis would, in my judgment, condemn the treatment. Besides, young infants are sometimes poisoned by very small quantities.

Dr. O'Dwyer, in closing the discussion on his paper, said: Pushing down of membranes does occur, though rarely. The difference between the liability to the accident in catheterization and intubation, is that the catheter has an open, comparatively broad end, while the intubation tubes are comparatively probe-pointed. One pushes and catches the membrane, the other slides past it. I have crowded membrane down in only two cases out of two hundred sufficiently to produce asphyxia. In those two, on removal of the tube, the cast was coughed out.

If we take away the tube because the child is breathing badly and the trachea is full of membrane, the child not having the strength to cough it out, the child chokes from the absence of the tube, not from its previous presence. My attention is now being directed to devising a means to get rid of the membrane. I hope to present something practical before long.

Blocking with membrane while the tube is in may occur. Formerly, when the swell of the tube was not so great, it would be coughed out, but now it is not coughed out, and suffocation may take place. The original tube was better in this regard. The earlier tubes were made to fit into the ventricles with the idea of permitting the approximation of the ventricular bands, but it did not work. It is true that the epiglottis is merely an accessory, but in an intubation case the ventricular bands being held open we have to depend upon it; and that is the reason, the dependence being a poor one, that solids and semi-solids which can go down in mass are better than liquids.

MEDICAL SOCIETY OF NEW JERSEY.

ONE HUNDRED AND TWENTY-SECOND ANNUAL MEETING, SCHOOLEY'S MOUNTAIN, N. J., JUNE 12 AND 13, 1888.

First Day, Tuesday, June 12.

At four o'clock, P. M., on Tuesday, June 12, the Society convened in the large parlor of the Heath House, Schooley's Mountain.

The meeting was opened by prayer, by the Rev. Hugh Smythe.

The calling of the roll showed about one hundred delegates present, and the number in attendance was increased by the presence of many visitors. Among those who were formally received by the Society as its guests were: Dr. Adam C. Deane, of Massachusetts; Drs. Bulkeley, G. Grant, Gibney, Tanner, and Morrow, of New York; and Drs. Packard, Seiler and De Forest Willard, of Philadelphia.

The afternoon session was devoted to routine business, the appointment and the reports of committees. The Society was welcomed to the mountains by Dr. J. G. Ryerson, who spoke of the value of the mountains as dispensers of pure air and good health to all comers, and pointed expectantly to the time when the villas on the mountains would be as the sands, or the cottages on the sand, of the sea. He spoke of the appropriateness of this visit of the oldest of the State Societies to this, the oldest of the health resorts.

After a short adjournment for dinner, the Society convened at 8 P.M.

Dr. John W. Ward, of Trenton, delivered the President's address. His subject was the

Responsibility of the Insane.

He urged the importance of the medical factor in determining the accountability of those pleading insanity as an excuse for crime. The term "mental disease" is unforunate; insanity is not a disease of the mind, but a disease of the brain—a physical disease. In marked cases it does not need an expert to tell that the mind is deranged; but there are cases in which the disease is so subtle as hardly to be recognized by the victim's intimates until some untoward act is perpetrated. In these cases medical opinion alone is of value in determining responsibility.

Between that psychological condition which elects to do evil instead of good, and which does this the more readily because of heredity, education and surroundings, and mental derangement due to diseased brain, there is a line to be drawn, and upon this line rests the question of responsibility. Neither the popular idea that insanity transforms the individual, nor the legal idea that insanity is some mysterious abstraction that renders the individual powerless to reason, is correct.

He then gave a historical review of the many theories regarding insanity, and their effect upon criminal laws and judicial decisions. Coming down to modern times and quoting Chief Justice Hornblower's ruling in the Spencer case, "that the burden of proof of insanity is on the accused, and whatever the amount of insanity present, if he is conscious at the time of committing an atrocious act, he is guilty in the eyes of the law," Dr. Ward said: such rulings are not right. Insanity is not a question of metaphysics or of morals, it is a question of disease. The insane act from well-defined motives, and are influenced by passions and by revenge, in the same manner as the sane are. A delusion or hallucination is a reality to him who is thus affected. The pivotal point on which responsibility should rest is the dependence of the criminal act upon the insanity of the individual.

Insanity in these cases consists, not in preferring vice to virtue, in applauding crime and deriding justice, but in being unable to discern the essential identity of nature between a particular crime and all other crimes, whereby they are led to approve what in general terms they have already condemned. Dr. Ward advocated the establishment of a Board of Experts to advise with a court in all such cases, who should examine the case as medical men and officers of the court to determine insanity and responsibility.

The Standing Committee submitted a report founded upon the reports of the various district societies. It was exceedingly long, and portrayed the health of the State down to very minute details. It indicated that malarial diseases have steadily decreased all over the State, and that the physicians of the State have about the usual amount of contagious and seasonal diseases to combat.

Drs. Baldwin, Rodgers, and Quimby, discussed the question of the

Relation of Laundry and Dish-Water to the Spread of Disease.

Nothing particular was developed by this discussion.

Dr. Lehlbach opened the second subject for discussion,

What Treatment will Most Effectually and Promptly Curtail the Course of Acute Rheumatism?

with a paper which he summed up as follows:

First. It should be treated as early as possible, and the public should be educated to understand that we do know something about it.

Second. Rest at the incipiency of the disease is essential to the rapid curtailment of its course.

Third. Individualization in every case should be carefully observed, and each case

should be treated by itself, and routine avoided.

Fourth. Being a disease probably due to specific causes, probably microbic, it should be treated by such remedies mentioned as experience, both empirical and scientific, shows to be efficient.

The session adjourned at 10.30 P.M., to partake of a banquet served by the proprietors of the Heath House.

Second Day, Wednesday, June 13.

The third subject for discussion,

The Treatment of Phthisis by Gaseous Enemata,

was opened by DR. STICKLER, who gave an interesting *résumé* of cases which strengthen the general opinion of the profession, that the gaseous method is not a success.

The various reports of delegates to corresponding societies were then received, and addresses were made by delegates from other State Societies and by visitors from other places.

DR. JAMES S. GREEN, the third Vice-President, read a paper entitled

A Review of the Surgery of the Knee-joint for the Last Fifty Years.

This was a finished and thorough study of the surgery of the knee-joint; the various phases and methods of the different periods of surgical science, and especially the modern methods, were carefully described, and their respective merits discussed and compared.

DR. PACKARD, of Philadelphia, discussed the paper, giving his views of the technique of the operation by incision, the value of backward drainage through the popliteal space, and the operation of erasion for gelatinous degeneration of the joint. He also spoke of the difference between the conditions, when foreign bodies are introduced into a joint and when it contains loose cartilages and pus.

DR. WATSON was invited to describe to the Society the experiments of Dr. N. Senn, made before the Surgical Section of the American Medical Association on the diagnosis of intestinal wounds by the hydrogen gas tests.

DR. PACKARD, of Philadelphia, requested the attention of the Society to the question of the establishment of State Boards of Examiners in Pennsylvania and New Jersey. He considered that serving on such mixed boards was in violation of the Code of Ethics. He quoted that part of the code which referred to this part, and claimed that serving on such a board was acknowledging regular medicine to be a sect, and that granting them licenses to practice was recognizing homœopaths and eclectics as true physicians and recommending them to the public as trustworthy practitioners. Homœopathy to-day is just as much a system of quackery as ever it was. They take advantage of all advances made in scientific medicine, but have added and do now add nothing to it. They practice under a flag whose principles they do not adhere to. It is much better to wait action until it can be taken without opposing the code, which is the one bond of the medical profession.

DR. PENNINGTON said that the views of Dr. Packard were in harmony with those of a committee appointed a few years ago on a cognate subject, and were those to which he could willingly subscribe.

DR. LEHLBACH, after a lively speech of a few minutes, wherein he divided the adherents of homœopathy into two classes, those who know better, and those who don't, preferring the latter, presented the following resolutions, which were carried:

"*Resolved*, That the following questions should be submitted to the District Medical Societies for consideration during the coming year:

First, Is it in the interest of the protection of the public against illegal and unqualified practitioners that State Boards of Examiners should be established?

Second, What would be the proper and best way of establishing such Boards?"

The third resolution directed that the action of the County Societies should be reported to the State Society at its next meeting.

The Nominating Committee presented the following nominations for officers for the ensuing year, who were immediately elected: *President*, H. Genet Taylor, Camden; *1st Vice-President*, B. A. Watson, Jersey City; *2d Vice-President*, James S. Green, Elizabeth; *3d Vice-President*, E. J. Marsh, Paterson; *Corresponding Secretary*, William Elmer, Jr., Trenton; *Recording Secretary*, William Pierson, Orange; *Treasurer*, W. W. L. Philips, Trenton; *Standing Committee*, T. J. Smith, Bridgeton; D. C. English, New Brunswick; J. G. Ryerson, Boonton. Next place of meeting, Spring Lake. The date to be announced.

DR. BARKER exploded a small bomb-shell in the convention by introducing a set of resolutions regarding the Morris Plains Asylum. There was much discussion immediately, and, after the sense of the meeting had been pretty well developed, resolutions were passed as follows:

Whereas, The Morris Plains Asylum for the Insane has for the last three years been managed upon what is generally termed the "dual system;" and,

Whereas, That experiment has drifted into a state of things that has resulted in a legislative investigation of alleged mismanagement; and,

Whereas, The proper treatment of insane persons can be fully carried out only when the medical staff has entire control over everything that pertains to the bodies as well as to the minds of the unfortunates committed to their care: therefore be it

Resolved, That the Medical Society of New Jersey hereby expresses its unqualified disapproval of any system of management that takes the food, the clothing, or any other physical want of the patients from the care and control of the medical staff, where it properly belongs, and places it in any other hands.

Dr. H. M. Weeks was appointed essayist for the next annual meeting.

Dr. Davis reported from the special committee having the matter in charge, a proposed law for the regulation of dissections.

After the usual vote of thanks the meeting adjourned.

Periscope.

Exudative Peritonitis of Children.

In the *Archiv für Kinderheilkunde*, IX, 2, Dr. Max Hirschberg communicates eight cases of undoubted chronic tuberculous peritonitis, and four cases of a non-tuberculous nature, from Baginsky's polyclinic. The clinical differential diagnosis between the two forms is extremely difficult, frequently about impossible. In favor of the tuberculous form are: tuberculous disease in the lungs, testicle, bones, lymph-glands; associated with marked, steadily progressive emaciation, hereditary taint, redness about the navel, with eventually formation of abscess and the detection of tumors by palpation.

Treatment consists in the maintainence of the strength of the patient, and if possible improving it by the use of strengthening food, iron, cod-liver oil, extract of malt, etc. Then the absorption of the exudate is to be started by diuresis and diaphoresis, cold water or cold wrappings. Inunctions with mercurial and iodoform ointment are to be tried. We are powerless against the tuberculous process proper. The author thinks König's proposal of laparotomy with antiseptic washing of the peritoneum is worthy of further trials. Early paracentesis, as proposed by Fiedler, he thinks can for the most part be dispensed with, as the end can be achieved without it.—*Deutsche Medizinal-Zeitung*, March 15, 1888.

Removal of Kidney for Pyonephrosis.

At the meeting of the Imperial Royal Medical Society of Vienna, March 9, 1888, Dr. Weinlechner presented a patient from whom he had removed the right kidney on account of pyonephrosis. She was fifty-one years old, and had suffered for ten years with pain in the right side of the abdomen, and soon after the occurrence of the pain she noticed a tumor, which continued to extend downwards, and was of changing size. In periods lasting three weeks there were fever and violent pains in the tumor; during this time the urine was clear and the tumor became larger; at the end of the three weeks the urine became purulent, the tumor became smaller, and the patient felt better. These periods during the first five years were infrequent, but became constantly more frequent, so that the patient was never free from pain. When Dr. Weinlechner saw her he found in the lumbar region a tumor extending four finger's breadth from the symphysis; fluctuation was marked, and the lower border of the tumor was easily movable. The diagnosis of pyonephrosis was made, and nephrectomy by the extraperitoneal method done October 18, 1887. About one pint of pus was first removed, and then the tumor itself. Recovery was prompt. The urine rose in amount from 20 to 30 ounces, and reached, on the twentieth day after the operation, 45 ounces.—*Deutsche med. Wochenschrift*, April 5, 1888.

Dicrotism of the Pulse in Insufficiency of the Aortic Valves.

Geigel (*Deutsches Archiv*, Bd. 42, Heft 4, 391) reports an interesting case which shows that the presence of dicrotism in a compound valvular lesion is no proof that the aortic valves are not affected. The patient when first examined exhibited typical signs of pure aortic insufficiency, and her sphygmographic pulse-tracing was that characteristic of this affection. Later, a fresh endocarditis developed, and then signs of mitral regurgitation. A new tracing now revealed the presence of distinct dicrotism. The author explains this in the following manner: In simple aortic insufficiency the contraction of the arteries drives the blood back into the empty, dilated, and yielding left ventricle, and there is consequently no secondary pulse-wave, or, at most, only a suggestion of one. If now the

mitral valve becomes insufficient, the left ventricle drives a considerable portion of its blood during the systole into the auricle. The greatly distended and over-filled auricle then returns this at the very beginning of the diastole into the ventricle, and the ventricle, now on its part fully distended, offers a resistance to the mass of blood tending to regurgitate from the aorta. The secondary pulse-wave is, therefore, again produced, just as though the aortic valves were sound. It was interesting to note in the case reported that the endocarditis appeared later to heal, while the systolic murmur and the accentuated pulmonary second sound disappeared. A pulse-tracing taken at this time showed the absence of dicrotism as when first examined.—*American Journal of the Medical Sciences*, May, 1888.

Inversion of Abdominal and Thoracic Viscera.

At the meeting of the Edinburgh Medico-Chirurgical Society, April 4, 1888, Prof. T. R. Fraser exhibited a case of inversion of the abdominal and thoracic viscera. The patient was a woman, 23 years old, who came under observation suffering from the effects of over lactation. She had nursed her child for thirteen months, and was weak and debilitated. Palpitation coming on, she noticed that there was a "beating" on the right side. For this she consulted Dr. Johnston, of Leith, who on discovering the peculiar nature of the case, sent her to see Dr. Fraser. Percussion and auscultation proved the case to be one of transversion of the heart, the position of which could not be accounted for by any previous illness. On further examination it was found that the stomach and spleen were also on the right side, while the liver was on the left—a complete inversion of these organs. The patient is one of a large family, six of whom have been examined, and in all the position of the viscera is normal. It is also normal in the case of her father, mother, and the child, showing absence of heredity.—*Medical Press and Circular*, April 18, 1888.

Asserted Antagonism of Certain Poisons.

At the meeting of the Biological Society of Paris, May 12, 1888, M. Roger said that he had made some experiments in the laboratory of Bouchard for the purpose of determining if, as asserted, the lethal dose of a poison is modified by the simultaneous introduction of another poison. He selected for experiment morphine, atropine, quinine and chlorate of potassium. He, in the first place, determined the toxicity of the drugs when they were injected into the veins; the numbers so obtained represent what Bouchard has called the toxic equivalents. He then mixed two of these bodies and investigated their united toxicity. "I have proved," said M. Roger, "that with mixtures of atropine and morphine, the animal dies even before having received the toxic equivalent of one of the two bodies; this is also true of mixtures of atropine and quinine, and of quinine and morphine." In all these cases, he says, the two substances re-enforce each other in their action and their toxic powers were duly increased. He says he has proved that mixtures of chlorate of potassium and of quinine have a toxic power nearly twice that indicated by the sum of the toxic powers of the components. When the potash salt is added to morphine, each substance acts as though it were alone, and the animal dies when it has received the lethal dose of one of the two poisons. In no case has he observed a toxic antagonism, that is to say, a more or less complete neutralization of one poison with another.—*Bulletin Médical*, May 16, 1888.

Gouty Peripheral Neuritis.

In an interesting account of a case of peripheral gouty neuritis, in the *Bristol Medico-Chirurgical Journal*, March, 1888, Mr. F. W. Jollye gives the following symptoms as being in favor of his diagnosis of peripheral neuritis:

1. The pain remained limited to one side for some time before suddenly appearing on the other. 2. The lightning-like pains in the extremities, and the "pins and needles" in the fingers and toes. 3. The marked tenderness of several nerve-trunks. 4. The hyperæsthesia and wasting of the muscles of the extremities, accompanied by the R. D. 5. The vasomotor disturbances. 6. The paralysis beginning in extensors and spreading towards the trunk, and afterwards affecting to a slighter extent the hands and arms. 7. The decided intermissions of pain which the patient frequently enjoyed during the earlier stages of the disease. 8. The relief from pain during the attack of gout. 9. The retention of urine coming on as a very late symptom. 10. No affection of the mental faculties. 11. Absence of bedsores.

Remarkable Case of Aneurism of the Thoracic Aorta.

Dr. Byrom Bramwell, who reports this case in the *Edinburgh Medical Journal*,

April, 1888, says that the case is remarkable from the fact that the patient was able to follow his employment for at least seven years with an aneurism projecting through the front wall of the thorax. The notes show that the patient was a foreman, 48 years old, who in February, 1887, was found to have a pulsating tumor, fully the size of half a cocoanut, projecting from the front of the left chest, between the clavicle and the fourth rib. The clavicle was pushed slightly forwards and upwards by the base of the tumor. The skin over the tumor was thin, and already beginning to present the blue, glazed, shining appearance so suggestive of approaching rupture. There was very forcible pulsation all over the projecting part of the thorax, and the contents of the sac appeared to be fluid. In addition to the dulness in front, there was well-marked impairment of the percussion note in the left supra-scapular and infra-scapular and in the inter-scapular regions.

A systolic murmur was audible over the tumor, at the base of the heart, and over the left side of the back; the aortic second sound was accentuated. The heart seemed enlarged as well as displaced downwards. The left pulse felt delayed when compared with the right.

The patient gave the following history of his case: Some fifteen years ago, while making a powerful effort in helping to lift and remove a boiler, he distinctly felt something give way in his chest, and fainted. After this strain he suffered more or less from severe pain in the left shoulder, left arm, and upper part of the left chest. These pains were thought to be rheumatic. One winter's day (according to his wife, seven years previous to his death, but as Dr. Bramwell has it in his notes, eight years ago) he fell while clearing snow of the roof of his house, and struck his chest with great force against the projecting knob of an iron railing. He became very faint, and turned of a dirty green color. After this, a lump gradually formed at the upper part of the left chest—the seat of the injury. He consulted the late Dr. Houston, who diagnosed the condition as aneurism of the thoracic aorta, and sent him to the Edinburgh Royal Infirmary, where he remained for several weeks. In the Infirmary the diagnosis of an aneurism of the thoracic aorta projecting through the front of the thorax was confirmed, and the iodide of potassium was administered in full doses. Under this treatment and rest, the pains in the chest and shoulder were much relieved, but the pulsating tumor, which was, he says, at that time about the size of a hen's egg, did not diminish in size. After his discharge from the Infirmary he returned home, and, contrary to the advice of the doctors, went back to work. He continued to follow his employment regularly until January of the present year, occasionally feeling pains in the shoulder and back, but seldom having been off work even for a single day. During the whole of this time the pulsating prominence remained in a stationary condition as regards size, his general health was very good, and he looked so well that he does not think that any one suspected that there was anything the matter with him. His hours of work were from 6 A.M. to 6 P.M. During the greater part of that period (twelve hours) he was on his feet, standing or walking about superintending the work in the manufactory; he used to go many times a day from the top to the bottom of the building, generally using the hoists, but not unfrequently (certainly several times a day on the average) walking from the bottom to the top of the stairs.

During the whole of period (seven years) he had no special treatment. Throughout life he has been a remarkably steady, regular-living man; he has never had rheumatism nor syphilis, and unless it were the accidents previously described he knew of no possible cause of the condition.

Some three months before this report was made, the pains in the chest, shoulder, and back became much worse, and the tumor at the same time increased in size.

Electrolysis was suggested, but he decided against the operation. It was therefore agreed to continue the iodide in full doses, to relieve the pain by subcutaneous injections of morphia, to keep the patient at absolute rest on his back in bed, and to apply a plaster as a support over the tumor externally.

The subsequent progress of the case was, as had been expected, short; the tumor continued to increase in size, and finally ruptured on March 12.

—At the Pennsylvania Hospital for the Insane in West Philadelphia, a cottage was formally opened June 16. This cottage is a step on the part of the hospital managers to establish a system of cottage treatment which will furnish patients who can afford it with more home-like surroundings, and group them into families. The cottage is attractive in its architecture and comfortable in its furnishing. It will accommodate about sixteen persons.

THE
Medical and Surgical Reporter.
A WEEKLY JOURNAL,
ISSUED EVERY SATURDAY.
CHARLES W. DULLES, M. D., EDITOR.

The Terms of Subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Quarterly Compendium of Med. Science, -	2.50
Reporter and Compendium, - - - -	6.00
Physician's Daily Pocket Record, - - -	1.25
Reporter and Pocket Record, - - -	6.00
Reporter, Compendium and Pocket Record,	7.00

All letters should be addressed, and all checks and postal orders drawn to order of

Drs. RANDOLPH & DULLES,
N. E. Cor. 13th and Walnut Streets.
P. O. Box, 843. Philadelphia, Pa.

TREATMENT OF CANCER OF THE LARYNX.

The recent death of the Emperor of Germany will attract attention anew to the important subject of the treatment of cancer of the larynx, which has been so much discussed during the year just past. The great question is: Shall cancer of the larynx be treated by a surgical operation or not? and, if by surgical operation, what one offers the best chance of success?

In studying this subject no one can overlook the fact that each case is likely to present peculiarities which must influence a decision, and prevent this from following strictly the general rules which can be deduced from a study of statistics. Still, these general rules are of great value; and they are, in fact, indispensable to a wise determination in any particular case.

It is with great interest, therefore, that we examine a careful paper on the treatment of cancer of the larynx published by DR. MAX SCHREIER, of Berlin, in the *Deutsche med. Wochenschrift*, June 7, 1888. In this paper Schreier gives the result of an analysis of the features presented by one hundred and twenty-five cases subjected to various methods of treatment. He found in the whole number only four which were treated without operation. Of these patients one lived but two months, one twelve months, one fourteen months and one two years after coming under medical observation. In seventeen cases tracheotomy was performed. Of these patients, seven died within eight days and the rest within nine months. In nine cases laryngotomy was performed and the growth removed through the incision. Of these patients, three died within fourteen days; in three there was recurrence of the morbid growth within about a year. Three patients are said to have been cured; but in the case of only one can this result be properly claimed. Partial extirpation of the larynx was performed in thirty-three cases. Of these patients five died within six weeks. In four cases recurrence took place within three months and in one after sixteen months. Four patients remained free from recurrence for periods varying from one to three months, two from three to six months, one for seven months, and one for fourteen months. These are hardly to be reckoned as cures, as the time of observation is too short. But five of the patients operated on in this way had no recurrence for periods varying from nineteen months to seven years, and may be regarded as having been cured.

Total extirpation of the larynx was performed in sixty-eight cases—a little over half of all. Eighteen of these patients died within two weeks, and five within six weeks. Recurrence took place in seventeen cases—in twelve within six months, in three within nine months, and in two at a later period. Six of the patients died of intercurrent disease, and twenty-two are said to have been cured. However, thirteen must be deducted from this number, as having been too short a time under observation, leaving only nine who remained free from cancer for periods varying from sixteen months to three years and a half.

Removal of the morbid growth through the mouth was attempted in four of the cases studied by Schreier, and only one of the patients can be fairly regarded as having been cured.

These results seem to indicate that the choice in the treatment of cancer of the larynx lies between letting the growth alone and performing partial extirpation of the

larynx. Tracheotomy, laryngotomy and total extirpation of the larynx seem to be much more dangerous to the life of the patient and the latter two to offer less hope of preventing recurrence, while the former, of course, is at best only a palliative operation; while attempts at removal through the natural passages do not offer much hope of a cure As between a purely expectant method and partial removal of the larynx, the choice is not clearly pointed out by a study of statistics, and it must be determined by the condition of the patient, and the character and extent of the morbid growth.

These conclusions are, we believe, of great value; although, as we have said above, they must be regarded not as establishing fixed rules, exactly applicable to all cases, but rather as indicating general principles which ought to be taken into careful consideration by all surgeons. Experience in the treatment of cancer of the larynx may justify the choice in any case of a method which seems less favorable than some other, regarded in the light of statistics alone; but we believe it will be wise for most of our readers to follow the indications we have pointed out, and to choose between leaving the case to Nature or giving the patient the chance of relief or cure offered by a partial extirpation of the larynx.

INDICATIONS FOR VAGINAL AND INTRAUTERINE IRRIGATION AFTER LABOR.

It has been but a short time since it was customary in lying-in hospitals to use the vaginal, and even the intra-uterine douche, as a routine practice during the puerperium, as a prophylactic against septicæmia. This measure was almost universally commended by authorities, and its introduction even into private practice urged by many. The method was based upon the indefinite ideas concerning the nature of puerperal infection then prevalent. And in England, where great stress is laid upon the exanthemata as frequent causes of puerperal mischief, and the atmosphere is regarded as a common medium of contagion, and auto-infection is considered a fact, this practice is still recommended. With the growth and more general acceptance of the germ theory of puerperal sepsis, the methods of infection have been more closely studied, and it is now the accepted belief that when infection occurs it is almost always during labor, or immediately after, and that the poison is conveyed upon the fingers, instruments or utensils brought in contact with the genitalia—the atmosphere serving as a medium of contagion only under rare and exceptional conditions. Also, that the genital passages of the healthy parturient, at the beginning of labor, are not septic. Thus attention has been directed toward disinfecting everything coming in contact with the parturient canal, instead of waiting until the poison has gained entrance, and then using germicidal solutions, by irrigation, to destroy it. Garrigues, whose teaching and results have largely influenced hospital practice in this country, uses a single vaginal douche after normal labor. Where efficient antiseptic precautions have been employed during labor, this cannot be regarded as a measure of disinfection, but rather as one of extra precaution, defensible in hospitals, on the ground of the almost ever present danger of infection, and that when given by the physician himself it can be used with safety. It can also be defended by the practical argument that the results of the method have been most excellent. This is a very different matter from the routine use of vaginal injection, during the puerperium, by the nurse. There are good reasons for the belief that infection has not infrequently occurred from the introduction of decaying organic matter on imperfectly cleansed syringe nozzles, where this method has been employed. In private practice, when a normal labor has been properly conducted, neither a vaginal nor intra-uterine douche is indicated.

By irrigation we may expect to accomplish two things: remove foreign matter, and disinfect the utero-vaginal canal. Hence irrigation is indicated whenever material liable to undergo putrefaction, such as particles of secundines, clots, or detritus from a macerated fœtus, is present or retained; and when infection is known to have occurred, or there

is reasonable ground to suspect it. It is a well-known clinical fact that tedious labor, and manual or instrumental delivery, favor puerperal sepsis. This is largely explained by the present views on the methods of infection. After such labors a single antiseptic irrigation is called for, since there is then reasonable ground for fearing infection. Where manipulations have been made within the cavity of the uterus, it, as well as the vagina, should be douched. So, also, where labor is complicated by a putrescent fœtus, or other matter, or by gonorrhœal vaginitis, irrigations should be used and continued.

Irrigation finds its best indication in the disinfection and removal of septic material from vagina and uterus. When a diagnosis of puerperal septicæmia is made, the douche should at once be used. Since infection takes place, in the majority of cases, through lesions of the vagina or vulva, only vaginal irrigation should be employed, unless the symptoms be urgent, or a relaxed uterus painful on pressure, points out the site of absorption. This irrigation is to be repeated at intervals of three or four hours. If the symptoms do not subside within six or eight hours, or if they grow worse, the uterus also should be washed out. Opportunity is afforded to examine the entire tract during the manipulations. After thoroughly douching the vagina, the aseptic finger should explore the vagina and cervix, and, assisted by the other hand manipulating through the hypogastrium, the uterine cavity, as far as possible. A patulous os, retained clots or fragments of secundines, a necrotic odor clinging to the examining finger, and tenderness or swelling of the uterine tissues are the most characteristic signs of involvement of the uterus. It should not be forgotten that a foul odor is by no means necessarily present in puerperal septicæmia, but that, on the contrary, it is frequently entirely absent. When such an odor is present it is usually due to putrefaction of the contents of the vagina or uterus, which, with an intact mucous membrane, may be present without septic absorption or fever. When attached fragments of placenta are present, especially if large, the use of the douche should follow the removal of the mass by the finger or curette. Shortly after intra-uterine irrigation, and especially after emptying the uterus of decomposing material, a chill with rise of temperature not uncommonly occurs. This is usually of short duration, and in general the temperature and symptoms are markedly influenced for the better. Especially may this happy result be expected in cases of putrid infection, where the fever is due rather to the absorption of the products of decomposition, than to the action of the virus on the tissues proper. The intra-uterine douche, where it is necessary to repeat it, should seldom be used oftener than once or twice daily. The vagina, however, may be irrigated at intervals of three or four hours. Iodoform, when used within the uterus, will diminish the necessity for the frequent use of the douche. Obviously injections give the best results when resorted to early. In cases of putrid absorption the reservoir of supply is removed, and in those in which the tissues are primarily invaded, the supply of the contagium is limited. When once the germs are within the tissues, they are beyond the influence of irrigation. In the unfortunate, progressive cases, in which tissue invasion has been great, the effect of local treatment is slight, and it is sometimes actually harmful, instead of beneficial. There is a growing opinion that the douche is useless under these circumstances. Mundé, especially, records himself as opposed to its routine continuance. Wherever there is putrid material to be removed, or a fetid discharge to be overcome, injections are indicated. But when these ends have been met, if the patient does not improve, and especially if shock is produced, after a fair trial the douche should be abandoned, or only an occasional vaginal injection be given.

The instruments necessary for the vaginal douche are, preferably, a fountain syringe and a bed-pan. The patient should not be disturbed during its administration. The two precautions necessary for safety are, to have the syringe free from air, and to secure

a free outflow for the solution. For irrigating the uterus the modified Bozeman canula is perhaps the safest and best instrument, being attached to a fountain syringe. Unless an examination is to be made, and except where difficulty is met in introducing the canula, the woman should not be disturbed. After douching the vagina, one or two fingers are introduced into the cervix, and the instrument gently inserted. Where no special instrument is at hand, the common semi-flexible catheter, with some additional holes for the exit of the fluid, answers the purpose admirably. Here the return flow must be especially watched. The solution should be allowed to flow until it returns clear and odorless. From one to three pints is required. After the tube is removed from the uterus any flaky matter is washed from the vagina. Here also safety depends on the exclusion of air from the irrigator, and the total discharge of the solution. The uterus is emptied by securing contraction with frictions and compression, assisted by the use of ergot, the vagina by retracting the perineum. Where difficulties are encountered, or an examination is to be made, the patient should be placed cross-wise on the bed, in the ordinary lithotomy position. Gentleness is highly important. Vaginal irrigation may be entrusted to the nurse; but the uterus should be washed out by the physician only.

For general use a solution of corrosive sublimate—one part to two or four thousand—is preferred, as being a safe and yet an efficient germicide. Where kidney disease or marked anæmia is present, a weaker solution—one to ten thousand—may be used, or the usual solutions may be followed by the weaker, by carbolic acid solution, or by plain boiled water. Carbolic solution, in a strength of from two and a half to three per cent., is efficient, but has the disadvantage of its odor. The solutions should be used at a temperature of 110° F. to 115° F. Cases of sublimate poisoning are reported; but where ordinary precautions are used to secure the thorough evacuation of all fluid from the uterus and vagina, they are certainly not to be expected.

HIGHER MEDICAL EDUCATION.

In the Reporter, June 2, 1888, we called attention to the steps which we believe to be most urgently needed for the improvement of the standard of medical education in this country. It is with satisfaction that we call attention now to the fact that, at the last meeting of the Medical Society of the State of Pennsylvania, a discussion which took place disclosed the fact that a very large majority of the members of the Society hold precisely the views which we do. The mind of the Society seemed clear as to the necessity for a general adoption of a three years' course of study, and the establishment of State Examining Boards. An effort was made by one member of the Society to prevent endorsement of a resolution urging State legislation of this sort in Pennsylvania, on the ground that it involved a breach of the Code of Ethics. The Society, however, showed plainly that it had no such idea itself, and went straight at the important subject, without stopping long over this antiquated and wearisome objection.

So much is a proper cause of congratulation to the profession. Another matter for congratulation just now is the fact that the Jefferson Medical College has just announced that it stands with those schools which exact a three years' course; and that, after the beginning of the Winter Session for 1890, which is the earliest moment practicable, in view of implied contracts with students already entered, it will exact three years of study from those who wish to have its diploma. This action is the result of a movement from the Faculty of the college, and recognizes the fact that no student can learn, in a two years' course, the things now necessary for a fit practice of medicine.

In connection with this announcement we note the assertion that Harvard and the University of Pennsylvania are the only medical schools in the East which have heretofore required three years of study from their students. This statement overlooks the Woman's College in Philadelphia, which is a three-year college; and it is in diametric opposition to the claims of another institution

in Philadelphia, which states in its catalogue that its term is three years. We have before this heard it said that this claim is not true, and that there are ways in which men who have not been studying three years in any medical school can get a degree from it. We trust there is a mistake about this, and that all the regular medical schools in this city can be counted on as conscientiously devoted to the principle of three years of study. They are all openly committed to the principle, and openly advocate State examinations to decide the question of fitness for a license to practice. This, as we have said before, is an end for which all who desire the advancement of medical education in this county should strive, and it is a state of affairs which no really good medical school should fear.

PUBLIC DISINFECTION.

We learn from the *Bulletin Médical*, May 30, 1888, that the General Council of the Seine has decided to procure light movable ovens, intended for the disinfection of linen, clothing and hangings which have been used on or about persons affected with contagious diseases. The Prefect of Police has also sent out a circular to various officers of the city, notifying them that each canton of the Department of the Seine is provided with one of these apparatuses, and where it is to be found. One of these heating appliances is to be sent free of charge to any place named by a physician, to be used for disinfecting linen, mattresses, covers, curtains, carpets, and such things; and the public officers are instructed to inform the people of their neighborhood that the means of disinfection thus supplied—steam under pressure—is efficient and will not injure the fabrics subjected to it.

This excellent plan might well be adopted in other cities than Paris. In our own country, it would be a wise thing to provide similar means of disinfection, which could be taken to different houses when infectious diseases have occurred, and used without charge by those who need them. Nothing is more difficult sometimes than to carry out a thorough disinfection of the premises in which a contagious disease has run its course. For the poor, the expense is often a serious obstacle; and for the rich the means of disinfection are often almost impossible of attainment. There are very few cities—perhaps there are none—to which such a provision as has been made in Paris would not be a great boom; while, if it were the means of limiting the spread of contagious diseases, its value to the community would be inestimable.

We commend the example of Paris, in this respect, to the notice of our readers, and to our countrymen in general, adding the suggestion that such a service of portable disinfecting machines be joined to a well-ordered system of disinfecting houses. The two belong naturally together, and deserve to be put in practice in this country.

SUPRAPUBIC LITHOTOMY.

At the last Congress of the German Surgical Society, Dr. Neuber, of Kiel, proposed a method of performing suprapubic lithotomy, or cystotomy, in "two times," which he thinks will obviate the risks of peritonitis and phlegmonous infiltration of urine. His method consists in cutting down to the bladder, and attaching it by a few sutures to the edges of the abdominal incision. The wound is then tamponned, and kept open for five or six days. At the end of this time the bladder is cut into, and the purpose of the cystotomy is carried to completion. An attempt is now made to secure union of the wound by first intention, and, if this is not successful, it is treated by drainage and continuous baths.

This method is only a modification of one which is by no means recent; for it is said to have been put in practice at least once in 1773, by Le Blanc, and to have been proposed for regular employment in 1832, by Vidal de Cassis. After a few trials, however, it was entirely abandoned. It might be tried by any one who is too timid to perform suprapubic cystotomy in the usual way; but we agree with Von Bergmann and Trendelenburg, who think that the latter is generally as safe as that which Neuber proposes. The fact is that supra-

pubic cystotomy is not an operation essentially dangerous, and its chances are not materially improved by any attempt to secure union of the surrounding tissues before the bladder is opened.

NOT LIFE, BUT DEATH.

A number of the daily papers of this country have recently cited the following interesting story, taken from the Aroostock *Pioneer*, as furnishing an instance of the power of the mind in prolonging life: A young married man, who was married last fall, had pneumonia. His wife was in Minnesota, where he had intended to join her soon. A telegram was sent to her and she arrived in season only to see her husband alive. He seemingly fought against death to see her once more. As she entered the room he rose in bed and remarked, "I wanted to see you and am now willing to go." After these words were spoken he fell back upon the pillow, turned upon his side and expired.

It seems a pity to spoil such an interesting and romantic story; but the fact is that it illustrates, not the power of mind in prolonging life, but the peril of physical exertion when life is trembling in the balance. The poor fellow no doubt precipitated his death by rising in bed; and he might perhaps be living to-day, and have missed newspaper fame altogether, if he had kept on his back.

Book Reviews.

[Any book reviewed in these columns may be obtained upon receipt of price, from the office of the Reporter.]

A MANUAL OF THE OPERATIONS OF SURGERY, FOR THE USE OF SENIOR STUDENTS, HOUSE SURGEONS AND JUNIOR PRACTITIONERS. By Joseph Bell, M. D., F. R. C. S., Edin., Consulting Surgeon to the Royal Infirmary, etc. Sixth Edition, revised and enlarged. Small 8vo, pp. xvi, 336, with 4 plates. Edinburgh: Oliver & Boyd, 1888. Price, 6 shillings.

This is a handy volume which has met with much success in Scotland, and seems to deserve it. It is a very readable presentation of the operations taught at Edinburgh. It does not show much familiarity with the surgical work outside of Great Britain, and it may not be unfair to judge its general relation to it by the fact that it says "Dr. Bigelow, of Boston, has lately been highly commending a method which he has called litholapaxy"—which refers to an occurrence nine years ago, and by no means indicates the position of Prof. Bigelow or of his operation at the present day

ANNUAL OF THE UNIVERSAL MEDICAL SCIENCES. Edited by Charles E. Sajous, M. D., etc., and seventy associate editors, etc. 5 volumes, 8vo. Philadelphia and London: F. A. Davis, 1888.

These five handsome volumes are the results of a labor which cannot be appreciated by those who have not shared in it, and of a degree of enterprise on the part of the editor-in-chief and the publisher which is in the highest sense creditable to both. There is no work to compare with it in the English language, and only one or two in the world. It contains a selection of the points worth noting in the articles of value on medical subjects published during the year 1887, arranged and classified and subdivided, when the amount of matter permitted of it, into the subsections of a disease—etiology, pathology, treatment, etc. The associate editors have in most cases introduced their own views, and so the work is in reality more than a mere reference book, and compares very favorably with such publications as Schmidt's Jahrbücher, La Revue des Sciences Médicales.

This being the first year of issue, it is not remarkable to find a certain unevenness in the articles. Some of the editors have introduced too much of their own opinions, and some too little. Another defect, which we think of some consequence, is the brevity of the references, merely the name of the publication referred to being given, and no information as to date, volume, number or page. In this matter we think Virchow and Hirsch's Jahresbericht would furnish a suggestion for improvement.

As a whole, the work deserves much praise, and we can heartily commend it to the attention and patronage of our readers. It furnishes an excellent epitome of medical science for the year 1887 at a very reasonable price. We hope the work may continue and prosper!

Pamphlet Notices.

[Any Reader of the Reporter who desires a copy of a pamphlet noticed in these columns will doubtless secure it by addressing the author with a request *stating where the notice was seen* and enclosing a postage stamp.]

The Pulley Method of Advancing the Rectus, with Indications for its Employment. By A. E. Prince, Jacksonville, Ill. From the *Ophthalmic Review*, September, 1887, and the *St. Louis Med. and Surg. Journal*, March, 1888. 8pp.

An Aseptic Atmosphere. Club-Foot. A Rectal Obturator. Palatoplasty. By David Prince, M. D., Jacksonville, Ill. *Journal Press*, 1888. 30 pp.

—Dr. A. E. Prince's pamphlet contains an interesting and clear description of the method which he employs in the operation known as advancing the rectus. This consists essentially in placing a "pulley-suture" in the sclera, near the cornea, and looping through it another suture, which includes the capsule, muscle and conjunctiva. This method has given him excellent results, and he commends it to the notice of other operators. His pamphlet is illus-

trated with excellent wood-cuts, which add much to the value of the description of his method.

—This collection of reprints by Dr. David Prince is a little too comprehensive to permit of justice being done to it in the space at our disposal. The paper on an aseptic atmosphere has been noticed before; that on club-foot describes a method of operating and a shoe which shows great ingenuity. The rectal obturator described and figured does not seem to have been put to the test yet, and it is impossible to express any opinion as to its merits. The paper on palatoplasty describes a form of bead-suture and may be commended to the attention of those who operate for deformities of the soft palate.

Correspondence.

A Hydrophobia Question.

Editor Medical and Surg. Reporter:

Sir:—The following occurrence took place in this vicinity about fifteen years ago: Two young men, farmers' sons, belonging to two well-known families, both of whom were robust, healthy, and keen sportsmen, were upon the same day, at different hours, passing along the Ellisburg road, half a mile from this town, when they espied a dog lying along the fence—a dog strange to them, who were familiar with all the dogs in the neighborhood. With the instincts of sportsmen, each, unknown to the other, stopped, and stooped down to see what was the matter with it. Both were snapped at and bitten, the one on the finger; the other on the face. The wounds were so slight to these stout men that they paid no attention to the injury, and forgot it. In a few weeks (I made no memorandum at the time) they were taken sick within a few days of each other. They lived a mile apart. One was attended by the late Dr. Jennings, of this place, an old and experienced physician; the other by a homœopath. Dr. Jennings, who was familiar with tetanus, told me he had never seen a case of hydrophobia. When he paid his first visit he recognized a strange, and, to him, an unknown disease. On the next day the symptoms resembled what he had read of hydrophobia, and he asked his patient if he had been bitten by a dog. He said no, and it was only after much questioning that his patient could recall the above circumstance. In a few days the man died in great agony. The other man, attended by the homœopath, exhibited the same symptoms, told the same story, and promptly died. Neither ever knew that the other was sick. If the disease that attacked these two men was not hydrophobia, what was it? The dog disappeared without any other proof of its having rabies. Yours truly,

John R. Stevenson.

Haddonfield, N. J., June 8, 1888.

[Our correspondent asks a hard question, and we do not expect to be accused of timidity if we decline, at this distance, and after a lapse of fifteen years, to make a diagnosis in regard to cases of which we have so brief and incomplete an account. Considerable experience in meeting queries like this has demonstrated the fact that it is not wise to turn aside from a systematic study of any disorder to answer individual objections founded upon isolated and more or less imperfect observations. We can assure our correspondent that stories far more credible on their face than the one he gives, have been found to be wholly incorrect. His may also be incorrect in some important detail; and it can no more settle the specific nature of so-called hydrophobia than any other of many which are hard to explain.

We publish his account of these cases, so that others may hear of them and give them what weight they deserve. But we have no idea that they are conclusive of anything, except the faith of the doctors and patients in hydrophobia.—Editor Reporter.]

Spermatorrhœa and Pulvermacher's Belts.

Editor Med. and Surg. Reporter:

Sir:—I would like to know what your opinion is of Pulvermacher's belts for the cure of spermatorrhœa; and would you recommend it for this disease? Please answer through your journal, of which I am a reader, and oblige, Yours truly,

Philadelphia, June 13, 1888. Medical Student.

[The only sensible course to pursue in spermatorrhœa is to consult a medical man in whom one has confidence, and to run no risks from any "quack" method of treatment.—Ed. Reporter.]

Quadruple Amputation; Correction.

Editor Med. and Surg. Reporter:

Sir:—I see a mistake has been made in the strength of the dressing solution in the report of quadruple amputation by me in the Medical and Surgical Reporter, May 26, 1888. It should read: "After operating I used hydr. chl. cor. ℥iv, sp. vini rect. f℥iv; one teaspoonful of the mixture to one pint of tepid water. It now reads, hyd. chl. cor. ℥iv, sp. vini rect. ℥iv. This is entirely too strong. Please correct.

Yours truly, G. C. Wallace, M.D.

Rock Rapids, Iowa, June 11, 1888.

Notes and Comments.

A Madstone in Chicago.

The New York *World*, of June 10, says that a State Street bookseller has a madstone which is reported to have made some marvellous cures of threatened hydrophobia lately. The fifth case within thirty days was a little boy who was bitten by a pug dog a few days before. The stone was applied two days later, and adhered until the next morning. The worst case of the five was that of a little girl, who was bitten by a dog five days before the stone was applied. The attending physician said erysipelas had set in; the hand had turned black and was swollen out of shape; she was very feverish and had become sick. The stone adhered four days, when the patient was apparently perfectly well. In every case, it is alleged, a perfect cure has followed the use of the stone.

This is what they tell about Chicago.

Sam Jones on "Faith Cure" and "Christian Science."

"I'll tell you where this faith cure comes in. There's an old brother and a sister who have been taking all the nasty, quack patent medicines on the market for the last ten years. Somebody comes along and prays over 'em, and they quit using the patent medicines, and they are well again. They say it was faith that cured. It was faith. It was faith which caused them to quit taking old patent nostrums, which cured them."

"I don't say I belong to the Christian Science crowd, or anything of that sort; but I thank God, that by the side of my sick wife I may kneel down and pray that the remedies given by the physician may prove effective. I don't pray over the supernatural. I pray over the pill.

A "Christian Scientist" Gets Off.

The Grand Jury for Middlesex County, Mass., in its report June 10, found no bill against Mrs. Abbie H. Corner, the Christian Scientist of West Medford, charged with manslaughter in causing the death of her daughter, Mrs. Lottie A. James, by neglecting to provide proper medical assistance at the time of her confinement on March 18.

Authority of Boards of Health.

At the meeting of the Board of Health of Philadelphia, June 13, an opinion of the Attorney General was read, which states that acts of Assembly which he quotes "clearly embrace and imply the power in the Board of Health of a city of the first class, and the proper health officer under their direction, to remove a person infected with small-pox to the hospital without his consent, or, if a minor, the consent of his parents and guardians." He further states: "If vaccination is a precaution reasonably necessary to limit the spread of contagion in the public schools, and the presence of an unvaccinated pupil endangers the general safety, or is a condition likely to directly result in the propagation and spread of disease among pupils generally, then it would be proper, by regulation, during the time of the prevalence of such disease, or in view of its threatened approach, to exclude such pupil from contact with the other attendants upon the school." There is a very big "*if*" in this opinion!

Remedy for Catarrhal Affections of the Respiratory Tract.

The *International Medical and Surgical Synopsis*, May, 1888, says: Through our friend, Dr. Phillip Scholz, we learned of a combination of remedies used some years ago by an old French physician of this city, in all catarrhal affections of the respiratory tract. We have had occasion to use it in the large clinic attached to the college, in the cases named, and for the mitigation of the cough of phthisis. The mixture is as follows:

℞ Terebene .....f℥viiss
Coniine.....℥ss
M. S.—Four drops to be administered to an adult every four hours.

The same compound is to be used by inhalation, twenty to thirty drops being mixed with a cupful of hot water, and the vapor inhaled through a funnel, two or three times a day.

In a number of cases of phthisis pulmonalis, in which all the known remedies to allay cough were tried to no avail, the combination acted admirably.

Hydrofluoric Acid in Digestion.

Most of the authors who have employed hydrofluoric acid in the treatment of phthisis have been struck with the fact that the patients who use it show decided increase of appetite. Lépine suggests that this action is the result of a direct influence of the acid upon the mucous membrane of the stomach. In order to test this he gave the drug to chlorotic patients and found that it answered as well as hydrochloric acid.—*Bulletin Médical*, April 15, 1888.

SUCCUS ALTERANS

(McDADE.)

SUCCUS ALTERANS is a purely vegetable compound of the preserved juices of Stillingia Sylvatica, Lappa Minor, Phytolacca Decandra, Smilax Sarsaparilla and Xanthoxylum Carolinianum, as collected by Dr. Geo. W. McDade exclusively for Eli Lilly & Co., and endorsed by Dr. J. Marion Sims.

SUCCUS ALTERANS continues to gain favor from its remarkable Alterative and Tonic properties, *eliminating specific poison from the blood* and *increasing the proportion of red corpuscles in anæmic patients* to a wonderful degree.

SUCCUS ALTERANS in venereal and cutaneous diseases is fast supplanting Mercury, the Iodides and Arsenic; and is a certain remedy for Mercurialization, Iodism and the dreadful effects often following the use of Arsenic in skin diseases.

SUCCUS ALTERANS is also strongly recommended for its Tonic and Alterative effects in myriad forms of scrofulous disease, and in all cases where anæmia is a factor. Such patients rapidly develop a good appetite, sleep soundly and gain flesh rapidly. Many cases are on record where patients increased ten to twenty-five pounds in weight in a few weeks.

SUCCUS ALTERANS is giving satisfactory results in treatment of *Chronic Rheumatism* and can be used with confidence.

SUCCUS ALTERANS may be given for any length of time, without injury to the patient.

SUCCUS ALTERANS is endorsed by the medical profession and in use by many hospitals of note.

PHYSICIANS who have not received Dr. McDade's latest publication, the Monographia Syphilitica, should send their address, mentioning this journal, and we will mail a copy. It contains a paper, illustrated with colored plates, by Dr. D. H. Goodwillie, of New York, on the "Sequelæ of Syphilis," reports of cases in practice and many other valuable papers.

ELIXIR PURGANS.

Elixir Purgans (Lilly) reliably stimulates the dormant liver without undue irritation, and has gentle yet positive effect upon the alimentary tract. In Habitual Constipation, so common in Women and Children, it will be found particularly useful. Its endorsement at Bellevue and many other prominent hospitals east and west, as well as its employment in general practice by the most eminent medical men, confirms the experience of years in its use.

Each Teaspoonful Represents	
Rhamnus Purshiana, -	10 grs.
Euonymus Atropur., - -	8 grs.
Cassia Acutifolia (Purif.) -	10 grs.
Iris Versicolor, - - -	4 grs.
Hyoscyamus Niger, - -	2 grs.
Aromatics, etc.	

IN PRESCRIBING, PLEASE BE CAREFUL TO WRITE

ELIXIR PURGANS (LILLY),

THAT OTHER PREPARATIONS MAY NOT BE SUBSTITUTED.

HIGHLY RECOMMENDED.

We take pleasure in endorsing the Elixir Purgans (Lilly) as prepared from the above formula, for in it we find a near approach to positive *perfection* in the form of a *Liquid Cathartic*, and, from our experience with the preparation, can highly recommend it to the profession.

JAMES R. HEALY, M. D., *Sup't Infants' and Children's Hospital, Randall's Island, N. Y.*

ELI LILLY & CO., **Pharmaceutical Chemists, Indianapolis, Ind., U. S. A.**

SUPPLIED BY ALL DRUGGISTS.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

SEABURY & JOHNSON, New York and London,

—ALSO A FULL LINE OF—

Medicinal and Surgical Plasters, Absorbent Cottons, Lint and Gauze, plain or with any desired medication; Ligatures, Silk and Rubber Protectives; Plaster Paris Bandages; Lamb's Wool, Paper and Wood-Wool; and Surgical Dressings, Plasters and Antiseptics of every description.

—SPECIAL FORMULÆ TO ORDER.—

Avoid Cheap Imitations by Always Specifying "SEABURY'S" or "S. & J."

MALTINE.

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms, is the only Malt Preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides and the Iodides.

It deserves to stand in the front rank of constructives; and the constructives by their preventive, corrective, and curative power, are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may often be resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan and Dimmock, *only three* possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract and Keppler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. R. H. CRITTENDEN, *Professor of Physiological Chemistry in Yale College.*

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe; and recent analysis made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other Malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	**MALTINE** with Peptones.	**MALTINE** Ferrated.
MALTINE with Alteratives.	**MALTINE** with Pepsin & Pancreatine	**MALTO-YERBINE.**
MALTINE with Cod Liver Oil.	**MALTINE** with Phosphates, Iron	**MALTO-VIBURNIN.**
MALTINE with Hypophosphites.	Quinine and Strychnia.	**MALTINE** with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "MALTINE" should be written, and not simply the words "Malt Extract" or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply the regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

The Maltine Manufacturing Co.,

Laboratory, Yonkers-on-Hudson. **182 Fulton Street, New York.**

CARNRICK'S SOLUBLE FOOD

Is the only infant's Food manufactured that perfectly nourishes the child without the addition of cow's milk. We do not except the so-called milk Foods, for they contain but a *very small percentage* of the solid constituents of cow's milk. Most of the credit given to prepared foods belongs to cow's milk which must be added to them or the child would starve.

Carnrick's Soluble Food is composed of about equal proportions of the solid constituents of cow's milk, partially digested, and wheat flour, the starch of which is converted into dextrine and soluble starch.

Thomas H. Rotch, M. D., Instructor in Diseases of Children, Medical Department of Harvard, University, in the Boston Medical and Surgical Journal, Sept. 29, 1887, *says:* "Cow's milk is the universal menstruum of infant Foods all over the world, and is the *actual food* which the infant is getting; hence it is irrational and unfair to speak of and give the credit to the various artificial foods, when we really should speak of cow's milk, with its modification to a greater or less degree by certain adjuvants under the name of infant Foods, which all supply about the same variety of ingredients in common; such small amounts of these ingredients as to be of little benefit in nourishing the infant *and would not nourish it unless aided by cow's milk.*"

CARNRICK'S SOLUBLE FOOD

is positively the only Infant's Food manufactured to which the foregoing criticisms do not apply.

BEEF PEPTONOIDS.

(Concentrated Beef and Milk with Gluten.)

Is the most concentrated and easily digested nutrient that has ever been introduced to the medical profession. Beef Peptonoids in the form of a powder is not a pure peptone, only one-fourth being digested. We are confident that you will find Beef Peptonoids in all cases where you desire a concentrated and easily digested food superior to any preparation in the market, or that can be prepared in the household.

The following are the opinions of the most eminent authorities in the world:

Prof. Attfield says of Beef Peptonoids: "It is by far the most nutritious and concentrated Food I have ever met with."

Prof. Stutzer says: "When the formation of flesh and blood is to be promoted and vigor infused into a patient, Beef Peptonoids for this purpose stands first and foremost amongst all the preparations I have examined."

LIQUID PEPTONOIDS

Is presented in the form of an elegant Cordial, containing twenty per cent. of spirits. Its nutritive constituents are wholly digested. It will agree with patients who reject all other foods.

PEPTONIZED COD LIVER OIL AND MILK

IS SUPERIOR TO OTHER PREPARATIONS OF COD LIVER OIL:

Because the *division of the oil globules is from twenty to one hundred times* finer than any other preparation of Cod Liver Oil ever produced, and consequently brought nearer the condition required for assimilation.

It is predigested, and is, therefore, more easily retained by weak and enfeebled stomachs and eructations are less liable to follow.

Samples sent on application by

REED & CARNRICK, N. Y.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

An Invaluable Aid in the Treatment of all Cases of Debility.

☞ ESTABLISHED 15 YEARS. ☞ ENDORSED BY SCORES OF PHYSICIANS. ☞ BEWARE OF IMITATIONS.

☞ ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, Soluble Citrate of Iron, Cinchona, Gentian, and simple aromatics. An official analysis of this preparation by the eminent chemist, ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement of by Sir ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

In the treatment of all cases of Debility, Convalescence from severe illness, Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Lack of Nerve Tone, and of the Alcohol and Opium Habits, and all maladies requiring a Tonic Nutrient, it is superior to all other preparations.

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion, and gives to weakened individuals that first prerequisite to improvement, an appetite.—By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label WITH IRON, "No. 1;" while the same preparation, WITHOUT IRON, is designated on the label as "No. 2."

☞ *I will, upon application, send a sample bottle of* COLDEN'S LIQUID BEEF TONIC *to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention* "COLDEN'S," *viz.,* "EXT. CARNIS FL. COMP. (COLDEN)." *It is put up in pint bottles, and* CAN BE HAD OF WHOLESALE AND RETAIL DRUGGISTS GENERALLY THROUGHOUT THE UNITED STATES.

C. N. CRITTENTON, Sole Agent, 115 Fulton Street, New York.

GLENN'S SULPHUR SOAP.

All physicians know the great value of the local use of Sulphur in the TREATMENT OF DISEASES OF THE SKIN. GLENN'S SULPHUR SOAP is the ORIGINAL and BEST combination of its kind, and the one now generally used. For sale by all Druggists at 25 cents a cake, or three cakes for 60 cents. Beware of counterfeits.

CONSTANTINE'S PINE TAR SOAP.

BY FAR THE BEST TAR SOAP MADE. Has been on trial among physicians for very many years as a toilet soap and healing agent, and its superior virtues have been unanimously conceded in ALL CASES WHERE THE USE OF TAR IS INDICATED.

Unsolicited expressions of its excellence have been received from the Medical Faculty generally. None genuine unless stamped "A. A. Constantine's Persian Healing Pine Tar Soap." For sale by all Druggists.

Wholesale Depot, C. N. CRITTENTON, 115 Fulton Street, New York.

Please mention this Journal. ☞ Samples of above Soaps SENT FREE on application to any physician enclosing card.

St. Louis College of Physicians and Surgeons.

The Ninth Academical year begins on September 1st and terminates on the last Saturday of May prox., comprising preliminary, regular and spring courses. The first and third optional. The regular session opens on the second Monday of October, continuing twenty weeks. The spring course offers all the opportunities of post-graduate instruction, inclusive of dissection, operations on cadaver, etc. Licensed practitioners by examination before Examining Boards or Boards of Health admitted to the graduating class. *Ad Eundem* degrees granted to graduates of two years standing by attending portion of regular course, and passing practical examination.

Fees for Academical Year,	**$50.00.**
Matriculation,	**5.00, paid but once.**
Graduation Examination,	**25.00, not returnable.**

Abundant anatomical material at nominal prices for anatomical, pathological and operative pursuits. Abundant clinical material in all branches, inclusive. Practical obstetrics.

For announcement and particulars, apply to

QUARTERLY COMPENDIUM OF MEDICAL SCIENCE.

Subscribers to the MEDICAL AND SURGICAL REPORTER can obtain a very valuable supplement to it at a very low rate. THE QUARTERLY COMPENDIUM OF MEDICAL SCIENCE comprises four numbers a year, about 150 octavo pages each, of Careful Selections and Translations from the best American and Foreign Medical Journals.

The selections are NOT DUPLICATES of what appears in the REPORTER, but DISTINCT AND INDEPENDENT ONES, most of them being longer than we care to put in the REPORTER.

The four numbers of The Compendium are sent to our subscribers for the nominal rate of $1.00 a year. To non-subscribers the price is $2.50 a year.

EVERY READER OF THE REPORTER OUGHT TO TAKE THE COMPENDIUM.

The January number will be better printed and handsomer than any before it, and will come out punctually on time--a thing which we believe never happened before. Address:

DRS RANDOLPH & DULLES,

P. O. Box 843. Philadelphia.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of **considerably greater strength** and **efficacy** than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—Prof. SEEGEN.

"After twenty years' use I appreciate it as highly as ever."—Prof. VIRCHOW.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

RIO CHEMICAL CO., ST. LOUIS: LONDON: PARIS.

Samples FREE to any Physician who will pay Express charges, and mention this Journal.

DR. RABUTEAU'S

[Laureate of the Institute of France.]

Dragees, Elixir and Syrup of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compte-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

A sample of Dr. Rabuteau's Dragees will be sent free to any Physician mentioning *The Medical and Surgical Reporter.*

Prepared by CLIN & Co., Pharmacists, Paris.

E. FOUGERA & Co., Agents for the United States.

Ducro's Alimentary Elixir,

A COMBINATION UNITING THE PROPERTIES OF

ALCOHOLIC STIMULANT AND RAW MEAT.

This preparation, which has been used with great success in the hospitals of Paris, since 1868, is adapted to the treatment of all diseases requiring the administration, in a small volume, of a tonic able to stimulate and support the vital forces, as *Pulmonary Phthisis Depression and Nervous Debility, Adynamia, Malarious Cachexia,* etc.

Prepared by EMILE DURIEZ & Co., Successors to DUCRO & CIE, Paris.

KIRKWOOD'S INHALER,

This is the only complete, reliable, and effective inhaler in use, arranged for the direct application of Muriate of Ammonia and other remedial agents in the state of vapor to the diseased parts of the air passages in the treatment of catarrh and diseases of the throat and lungs. No heat or warm liquids required in its use.

It is entirely different from the various frail, cheap instruments that have been introduced.

KIRKWOOD'S INHALER is accompanied by testimonials of the highest professional character, together with carefully-prepared formulas for use.

Retail Price, complete, $2.50.

☞A liberal discount allowed to the trade and profession.

☞For descriptive pamphlets or other information, address,

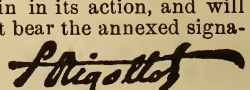
E. FOUGERA & CO., 30 North William Street, New York.

Rigollot's Mustard Paper.

Is one of the most important and useful discoveries of the age. It is the only preparation which has been adopted by the civil and military hospitals, and the armies and navies of France and England, and which has obtained a medal at the Centennial Exposition at Philadelphia. All other mustard plasters or leaves, of whatever name, are but imitations of the original.

Physicians will find it the most reliable sinapism prompt and certain in its action, and will therefore always prescribe it. Every sheet, in order to be genuine, must bear the annexed signature of the inventor.

Sold in tin boxes containing 10 sheets, also 25 and 100 sheets, by all respectable chemists throughout the world.



E. FOUGERA & CO., New York Depositaries.

LENTZ'S NEW COMPACT OPERATING SET, No. 10

One Amputating Knife (Leg and Arm). One Finger Knife. One Hernia Knife. One Sharp Curved Bistoury. Two Scalpels. One Tenotome. One Tenaculum. One pair Scissors, curved or flat. One Saw, 9-inch blade. ACCIDENTS AND EMERGENCIES.

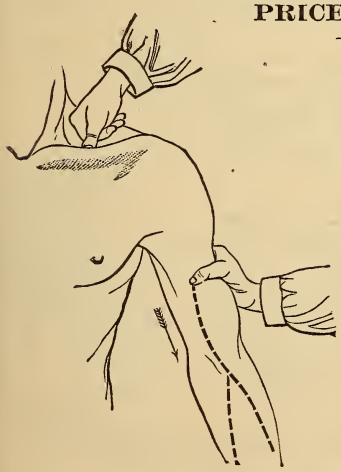
What to do First in Accidents and Emergencies.

BY CHARLES W. DULLES, M.D.,

SECOND EDITION, REVISED AND ENLARGED, WITH NEW ILLUSTRATIONS.

PRICE, - - - - - 75 CENTS.



☞ "Contains directions for taking care of persons who have been injured by machinery, of the apparently drowned and suffocated, how to stop bleeding from wounds, how to treat sunstroke, burns, scalds, exhaustion, all sorts of fits and seizures, sprains, earache, toothache, etc., pains and emergencies that must be looked after at once, before the arrival of the doctor, and hints useful to doctors themselves. Also proper remedies to keep in the house, their effects and uses, etc."

"The instructions in regard to the treatment of injuries and sudden illnesses are thoroughly practical, and the suggestions for supplies for emergencies are especially useful."—*New York Tribune.*

"It ought to be read once or twice each year."—*St. Louis Medical and Surgical Journal.*

"It is a book which no family ought to be without."—*Boston Herald.*

A good book to recommend to the Heads of Families.

Sent by Mail on Receipt of 75 Cents.

ADDRESS. **Drs. RANDOLPH & DULLES,**
P. O. Box 843. **PHILADELPHIA, PA.**

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are guaranteed.

Pancreatic Emulsion. In Consumption, Wasting, LOSS OF THE POWER OF DIGESTION AND ASSIMILATION, this pure drug is the MOST POTENT REMEDY. This is now attested by the published records of numerous medical men, extracts of which accompany each bottle.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions, forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition. Peptodyn is intended as a general promotor of digestion for persons not necessarily considered in bad health; thus, when taken about a quarter of an hour after a meal, it will be found to assist digestion in a remarkable manner, and prevent the discomfort which often follows the partaking of a full meal by persons in good health.

Pancreatine Powder, for Indigestion and Loss of APPETITE. This palatable and popular remedy effects the digestion and assimilation of all food, especially of FATTY SUBSTANCES, and is therefore invaluable to patients who are unable to digest Cod Liver Oil, and who are thus deprived of its nourishing and invigorating properties.

Gelatine Discs for Hypodermic Use—Of Morphia, CODEIA, ERGOTINE, ATROPIA, STRYCHNIA, APOMORPHIA, etc. The chief features of these discs are their instant solubility, by which hypodermic solutions can be instantly obtained of uniform and reliable strengths; they keep good for an unlimited period in their dry state, and are extremely portable. (Prepared in accordance with Dr. Sansom's recommendation.)
In tubes, each containing 25 discs.

Etherodine (Substitute for Chlorodyne). A clear, bright fluid, pleasant to the taste, readily miscible with water or any suitable menstruum. The therapeutical properties of ETHERODINE are identical with those of CHLORODYNE, but the former is an elegant preparation, and more convenient for use.

Gelatine Discs for Ophthalmic Purposes.
"Much smaller doses of medicaments such as Atropine, Calabar Bean Extract, Sulphate of Zinc, Morphia, etc., etc., suffice to produce a marked effect by this form of application, than when drops are introduced."—*The Lancet.*
In tubes, each containing 100 discs.

Gelatine Lamels for Internal Administration, consist of thin, pliable, and, in most cases, transparent sheets of uniform thickness, accurately divided into squares by raised lines, each square containing an exact dose of the medicine with which the sheet is impregnated.
In sheets, each consisting of 24 squares.

Datura Tatula, for Asthma, Hay Fever, and Chronic BRONCHITIS. Recommended by the Profession as a remedy of great power and usefulness in cases of short and difficult breathing, spasmodic coughing, etc. The most convenient forms for use are—
Datura Tatula Cigars. Datura Tatula—prepared for use by means of a pipe.
Datura Tatula Cigarettes. Datura Tatula Pastilles—for Inhalation.

SAVORY & MOORE, 143 New Bond Street, London.

Agents for America, E. FOUGERA & CO., New York.

THE BEST PREPARATION OF COD LIVER OIL.

Of the very many flattering testimonials to the value of

CASWELL, MASSEY & CO.'S

EMULSION OF COD LIVER OIL

WITH PEPSIN AND QUININE,

none has afforded the firm more pleasure than the following from Professor LOOMIS:

"19 West 34th Street, New York.

"I have used Caswell & Massey's Emulsion of Cod Liver Oil with Pepsin and Quinine for the past nine years, and it has given me greater satisfaction than any other preparation of Cod Liver Oil that I have used. I can most cheerfully recommend it to my professional brethren.

"ALFRED L. LOOMIS, M.D."

CASWELL, MASSEY & CO., Chemists,

1121 BROADWAY and 578 FIFTH AVE., NEW YORK, and NEWPORT.

ESTABLISHED 1849.

Special attention is called to the improved artificial Legs and Arms; apparatuses for Resection, for shortened legs, and ununited fracture; for the varieties of club-foot, bow-legs, knock-knees, and weak ankles. Spinal supporter; and apparatus for diseases and injuries of the hip joint.

Catalogue sent free, on application.

BUFFALO LITHIA WATER

FOR GOUTY, RHEUMATIC AND RENAL AFFECTIONS.

ROBERTS BARTHOLOW, M. A., M. D., LL.D., Prof. of Materia Medica and General Therapeutics in the Jefferson Medical College of Philadelphia. See his "Materia Medica and Therapeutics."

"Buffalo Lithia Spring of Virginia contains well-defined traces of Lithia, and is Alkaline. This has been used with great advantage in Gouty, Rheumatic and Renal Affections." * * * * * * "There is little doubt that the continuous use of Alkaline Waters for a long period will cause the solution of Uric Acid Renal Calculi. For this purpose those Alkaline Waters rich in POTASSA are preferable."

This water has a large percentage of the CARBONATE OF POTASSA, making it rich in valuable Alkali.

Dr. Wm. A. Hammond, of New York, Surgeon-General U. S. Army, (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

'I have for some time made use of the Buffalo Lithia Water in cases of affections of the Nervous System complicated with Bright's Disease of the Kidneys, or with a Gouty Diathesis. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the Buffalo Water certainly acts better than any extemporaneous solution of the Lithia Salts, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of Cerebral Hyperæmia, resulting from over mental work—in which the condition called Nervous Dyspepsia exists—and generally with marked benefit."

Dr. Robert Battey, of Georgia, Suggester of Battey's Operation, Member of the American Medical Association, etc.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of Chronic Inflammation of the Bladder, whether induced by Stone, by Enlarged Prostate in the aged, or by Neglected Gonorrhœa, and have secured excellent results, which encourages me to prescribe it for the future."

Dr. Hunter McGuire, Richmond, Virginia, late Professor of Surgery, Medical College of Virginia.

"Buffalo Lithia Water, Spring No. 2, as an Alkaline Diuretic, is invaluable. In Uric Acid Gravel, and, indeed, in diseases generally dependent upon a Uric Acid Diathesis, it is a remedy of extraordinary potency I have prescribed it in cases of Rheumatic Gout, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. Alfred L. Loomis, of New York, Professor of Institutes and Practice of Medicine, Medical Department University of New York.

"For the past four years I have used the Buffalo Lithia Water in the treatment of Chronic Interstitial Nephritis occurring in Gouty and Rheumatic subjects, with the most marked benefit. In all Gouty and Rheumatic Affections I regard it as highly efficacious."

Dr. Harvey L. Byrd, of Baltimore, President and Professor of Obstetrics and Diseases of Women and Children, in the Baltimore Medical College, formerly Professor of Practical Medicine, etc.

"I have witnessed the best results from the action of the Buffalo Lithia Water, Spring No. 2, in Chronic Gout, Rheumatic Gout, Rheumatism, Gravel, and Stone in the Bladder, and I do not hesitate to express the opinion that all diseases depending upon or having their origin in Uric Acid Diathesis, it is unsurpassed, if, indeed, it is equaled by any water thus far known to the profession.

"It has an ascertained value in Bright's Disease. A knowledge of its action in that disease thus far would seem to warrant the belief that it would, in many instances, at least in its early stages, arrest it entirely; and in its more advanced stages prove a decided comfort and palliative."

Water, in cases of one dozen half gallon bottles, $5.00 per case, at the Springs. Testimonials sent free on application. The Virginia Buffalo Lithia Springs Company have no longer control of the water. To get it **FRESH**, order directly of or from parties who deal directly with

<THOMAS F. GOODE, Prop., Buffalo Lithia Springs, Va.>

WATER FOR SALE BY

FRED. BROWN, or J. F. HAYES, Philadelphia.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

NEW AND RELIABLE RECIPES FOR PHYSICIANS PRESCRIBING.

In order to get the full therapeutic effects, physicians will please specify (WARNER & Co.) when ordering or prescribing.

☞The coating of the following pill will dissolve in 4½ minutes.☜

Pil: Chalybeate Comp.

(WARNER & CO.)

Nux Vomica is added as an ingredient to Pill Chalybeate to increase the tonic effect when desired.

Composition of each Pill.—℞ (Chalybeate Mass.), Carb. Protoxide of Iron, gr. 2½., Ext. Nuc. Vom. gr. 1-6.

DOSE—1 to 3 Pills.

Most advantageously employed in the treatment of Anæmia, Chlorosis, Phthisis, Scrofula, Loss of Appetite, etc.

Pil: Antiseptic Comp.

(WARNER & CO.)

Each Pill contains: Sulphite Soda, 1 gr. Salicylic Acid, 1 gr. Ext. Nuc. Vomica, ⅛ gr. Powd. Capsicum, 1-10 gr. Conc't Pepsin, 1 gr.

DOSE—1 to 3 Pills.

Pil. Antiseptic Comp. are prescribed with great advantage in cases of Dyspepsia, Indigestion, and malassimilation of food.

Pil: Antiseptic.

Each Pill contains: Sulphite Soda, 1 gr. Salicylic Acid, 1 gr. Ext. Nuc. Vomica, ¼ gr.

DOSE.—1 to 3 Pills.

Pil. Antiseptic is prescribed with great advantage in cases of Dyspepsia attended with acid stomach and enfeebled digestion following excessive indulgence in eating or drinking. It is used with advantage in Rheumatism.

Prepared by WM. R. WARNER & CO.

Supplied upon physician's prescription by all leading druggists.

QUARTERLY COMPENDIUM OF MEDICAL SCIENCE.

Subscribers to the MEDICAL AND SURGIGAL REPORTER can obtain a very valuable supplement to it at a very low rate. THE QUARTERLY COMPENDIUM OF MEDICAL SCIENCE comprises four numbers a year, about 150 octavo pages each, of Careful Selections and Translations from the best American and Foreign Medical Journals.

The selections are NOT DUPLICATES of what appears in the REPORTER, but DISTINCT AND INDEPENDENT ONES, most of them being longer than we care to put in the REPORTER.

The four numbers of The Compendium are sent to our subscribers for the nominal rate of $1.00 a year. To non-subscribers the price is $2.50 a year.

EVERY READER OF THE REPORTER OUGHT TO TAKE THE COMPENDIUM.

The January number is better printed and handsomer than any before it.

SPECIFY (BATTLE) WHEN PRESCRIBING OUR PREPARATIONS.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

THE MEDICAL AND SURGICAL REPORTER

Established 1853.

Aims to meet the average wants of the medical man, and to be interesting, instructive and clear, so as to be useful to the practitioner, rather than the laboratory student. Contains careful Reviews of New Books, Abstracts of the best Medical Journals all over the World, Items of News, and EDITORIALS prepared with especial regard to the good of its readers and the interest of the profession. It aims to be dignified; but not TOO SERIOUS, and to cultivate friendly and pleasant relations with all its readers.

Since May 1st, 1887, material improvements have been made in its appearance and character; and a liberal policy has been adopted toward its contributors and subscribers, which both have appreciated. We are happy to say that the subscription list is enlarging in a gratifying way. But we hope for a larger increase still. Price $5 a year. Any old subscriber sending a new name, with the money, may retain $2.00 of the amount.

TREATMENT OF CONSUMPTION.

A Simplified Apparatus for the preparation and introduction of gases into the bowel (according to Dr. Bergeon's method) by Dr. H. N. Bryan, of Philadelphia.

This Apparatus has advantages which others do not possess, and being considerably lower in price than any devised for a similar purpose, it should commend itself to the favorable consideration of the medical profession. An illustrated descriptive circular sent to any address, on application.

Price of Apparatus, complete, in a neat portable Telescopic Case with Handle, **$6.00.**

Sample Card of the Iron-Dyed Silk (14 sizes) will be sent to any address on application. Price Per Reel, - 10 cts.

WILLIAM SNOWDEN,
Manufacturer, Importer and Exporter of Surgical Instruments,
No. 7 South Eleventh St., Philadelphia.

STAUFER'S
HARD RUBBER SPECULUMS GUARANTEED.

Prices, Single, $2.50
Series encased, 12.00

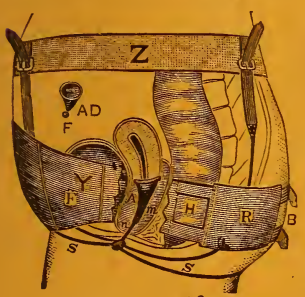
The engraving shows the shape, conductor and case so complete, that scarcely any description is necessary. For compactness there is but one conductor stem, on which each size of bulb screws. Speculums and case are all of the best quality hard rubber, and do not break from ordinary falling. Dental red enamelled inside. The mouth is polished very smooth, and shaped so that the cervix can be brought in entirely by rotation. And when brought in can be rotated to bring into view all the parts. The vaginal portion of the uterus can be seen as clearly as if located externally. When obtained, single, No. 2, is the most useful, since it reveals fully the point of the cervix in almost all multipara, and freely enters, when the position is correct, in many nullipara.

Guarantee.—One or two speculums are guaranteed; thus when returned sound and in the original wooden boxes, within six months of purchase, the money will be refunded without any deduction.

Plates.—The *First* contains 16 engravings and groups of engravings, illustrating the uterine examining instruments. *Second* contains 17 engravings and groups of engravings, illustrating the uterine replacing and supporting instruments.

Catalogue.—The catalogue comprises over 150 sizes and styles of uterine examining and supporting instruments, of which the hard rubber parts are exchanged and interchanged at cost, without limit of time. It also contains full directions and explanations for the use of this series of hard rubber gynecological instruments; together with common information collected through many years to simplify this line of treatment.

STAUFER'S
SPRING STEM UTERINE SUPPORTERS.
GUARANTEED.



Price, on Y, $6.00
" " Z, 5.00

The engraving shows the Spring Stem Cup, which consists of over a dozen sizes. The series contains Spring Stem Balls, Spring Stem Levers, for Anteversions and Retroversions. also Spring Stem Cup with posterior projections, all of assorted sizes.

Explanation.—The stem is screwed on cup A, and when unscrewed, the spring is put in tube *m*, or taken out when it needs cleaning. Thus the coil spring lays between the cup and base *n*. When there is pressure from above, or below, or both, the spring is compressed and again stretches out at the first opportunity. The movement of the base stem *n*, is governed by a slot and pin through tube *m*.

A D.—Represents the cup transformed into a self-sustaining cup, virtually an instrument of double capacity. In most cases after the uterus is held in "health line" for a time by external support, contraction of the walls of the vagina takes place, and it is sufficient at night or until forced down next day by bodily exertion, against which the stem and bandage guards if applied in time.

Belt Y.—The manner in which belt Y, sets on the abdomen is shown in above engraving. The widest or lifting part is in front. Over each hip as seen at H, are two elastics, and on large belts three. It closes on the back by buckling at B. It is of fine sateen outside, fine lining inside, and a slight stiffening between, and stayed with soft whalebones. Accurate hip measure is to be taken over a thin undergarment; since it needs to fit with a space of one or two inches apart on the back, for the buckle straps to draw. The perineal attachments are short and buckle at F and R.

Belt Z.—This is an elastic waist strap and carries any supporter of this series. Yet the common difficulty presents itself, where long and slender attachments are used, that they do not govern the internal part so efficiently as on the low grasping abdominal supporter Y.

The Series.—This series of imstruments has been invented as cases presented themselves, requiring different styles and sizes of instruments, without change of proprietor, until it has reached its present efficiency.

Guarantee.—The money lost by purchasing uterine supporters, unscientifically constructed, of irritating material, or limited in deficiency of sizes, and in consequence loss of families in practice, has set a large portion of the medical profession against the mechanical support of the uterus. By these conditions the risk of the first purchase by a physician of a stem and bandage supporter of this series is obviated. After the first purchase the instruments are supposed to be known, yet the guarantee is extended by special contract in doubtful cases.

Refunding.—On return of the hard rubber part or parts within six months of purchase, Four Dollars of the purchase money will be refunded. The belt remains with the patient as an abdominal supporter and only risk.

The above Guarantee and Refunding is secured when the Instrnments are obtained through this Office. Any other Instrument of STAUFER'S SERIES is also obtained through this Office at Catalogue Prices, and Catalogue free, on application.

Pocket Record and Visiting List.

The POCKET RECORD sold at this office for MORE THAN TWENTY YEARS cannot be excelled in practical utility as its very large sale testifies. The edition for 1888 is better than any before it. The introductory pages have been thoroughly revised and rewritten, and printed on better paper than heretofore, from entirely new stereotype plates.

Especial attention has been paid to correcting the section on examination of the urine, and to bringing the list of new remedies up to date. A finer and handsomer cover is provided and the spring-clasp is continued.

Pocket Record for 30 patients a week, $1.25
" " 60 " " 1.50

Paid-up subscribers to the Reporter can have either style for 25 cents less than the sum named above. Name stamped on outside for 10 cents extra.

P. O. Box 843. Drs. RANDOLPH & DULLES, Philadelphia.

Any one wishing the old style should state the fact when sending order.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recemmended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

SEABURY & JOHNSON, New York and London,

—ALSO A FULL LINE OF—

Medicinal and Surgical Plasters, Absorbent Cottons, Lint and Gauze, plain or with any desired dication; Ligatures, Silk and Rubber Protectives; Plaster Paris Bandages; Lamb's Wool, Paper Wood-Wool; and Surgical Dressings, Plasters and Antiseptics of every description.

—SPECIAL FORMULÆ TO ORDER.—

Avoid Cheap Imitations by Always Specifying "SEABURY'S" or 'S. & J."

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. INDISPENSABLE AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS

DARK A NON-ALCOHOLIC LIQUID. WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

RIO CHEMICAL CO., ST. LOUIS: LONDON: PARIS.

Samples FREE to any Physician who will pay Express charges, and mention this Journal.

HYDROLEINE

(HYDRATED OIL)

FOR CONSUMPTION AND WASTING DISEASES,

Produces Immediate Increase in Flesh and Weight.

FORMULA.

Each Dose of Two Teaspoonfuls equal to 120 Drops, contains:

Pure Cod Liver Oil...80 m. (drops)	Soda.....1.3 Grains.
Distilled Water.....35 "	Salicylic Acid.....1.4 "
Soluble Pancreatin.. 5 Grains.	Hyocholic Acid.....1.20 "

DOSE.—Two teaspoonfuls alone, or with twice the quantity of water to be taken thrice daily after meals.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhua, but a hydro-pancreated preparation containing acids and a modicum of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used completely saponifies the oleaginous material so necessary to the reparative process in all wasting diseases.

Each bottle in nutritive value exceeds ten times the same bulk of cod liver oil. It is economical in use and certain in results.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," by H. C. BARTLETT, Ph. D., F. C. S., *and the experiments which were made, together with cases illustrating the effect of Hydrated Oil in practice, are concisely stated in a Treatise on "Consumption and Wasting Diseases," by* G. OVEREND DREWRY, M. D.

Copies of these works sent free on application.

SOLD AT ALL DRUG STORES, AT $1.00 PER BOTTLE.

C. N. CRITTENTON,

Sole Agent for the United States. **115 FULTON STREET, NEW YORK.**

A sample of Hydroleine will be sent free upon application, to any physician (inclosing business card) in the United States.

Maiden Lane.

TRUE SALICYLIC ACID

CRYSTALIZED FROM

WINTERGREEN OIL—its natural source.

Dr. P.W. LATHAM, Downing Professor of Medicine at Cambridge, (England), lecturing on the treatment of gout and rheumatism at the Royal College of Physicians, says:

"The true Salicylic Acid obtained from the vegetable kingdom must alone be employed. If you have to give large doses, avoid giving the artificial product obtained from carbolic acid, however much it may have been dialysed and purified. Give the acid without any alkali or base," etc.

A reprint of this exceedingly valuable paper will be sent on application.

Boro-Glyceride—Solution 50 per cent.

An invaluable antiseptic and healing dressing; extensively used in surgery, gynecology and ophthalmology.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well-known medical writer and journalist has become axiomatic:

"No remedy for physicians' use has been received with such universal approval."

Orders and communications of any kind received at either of our offices will have prompt attention.

QUARTERLY COMPENDIUM OF MEDICAL SCIENCE.

Subscribers to the MEDICAL AND SURGIGAL REPORTER can obtain a very valuable supplement to it at a very low rate. THE QUARTERLY COMPENDIUM OF MEDICAL SCIENCE comprises four numbers a year, about 150 octavo pages each, of Careful Selections and Translations from the best American and Foreign Medical Journals.

The selections are NOT DUPLICATES of what appears in the REPORTER, but DISTINCT AND INDEPENDENT ONES, most of them being longer than we care to put in the REPORTER.

The four numbers of The Compendium are sent to our subscribers for the nominal rate of $1 00 a year. To non-subscribers the price is $2.50 a year.

EVERY READER OF THE REPORTER OUGHT TO TAKE THE COMPENDIUM.

The January number is better printed and handsomer than any before it.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

☞ Prepared from Manna, Purified Cathartic Acid, and Fruit Juices. ☜

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. INDISPENSABLE AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS
DARK A NON-ALCOHOLIC LIQUID. WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

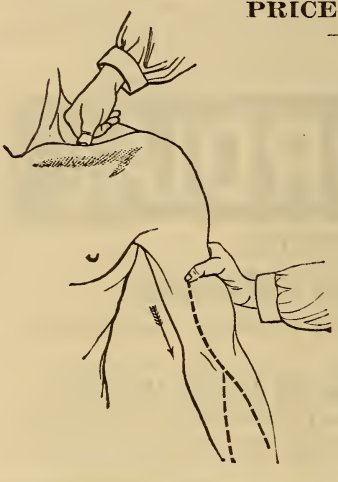
ACCIDENTS AND EMERGENCIES.

What to do First in Accidents and Emergencies.

BY CHARLES W. DULLES, M.D.,

SECOND EDITION, REVISED AND ENLARGED, WITH NEW ILLUSTRATIONS.

PRICE, - - - - 75 CENTS.



☞ "Contains directions for taking care of persons who have been injured by machinery, of the apparently drowned and suffocated, how to stop bleeding from wounds, how to treat sunstroke, burns, scalds, exhaustion, all sorts of fits and seizures, sprains, earache, toothache, etc., pains and emergencies that must be looked after at once, before the arrival of the doctor, and hints useful to doctors themselves. Also proper remedies to keep in the house, their effects and uses, etc."

"The instructions in regard to the treatment of injuries and sudden illnesses are thoroughly practical, and the suggestions for supplies for emergencies are especially useful."—*New York Tribune.*

"It ought to be read once or twice each year."—*St. Louis Medical and Surgical Journal.*

"It is a book which no family ought to be without."—*Boston Herald.*

A good book to recommend to the Heads of Families.

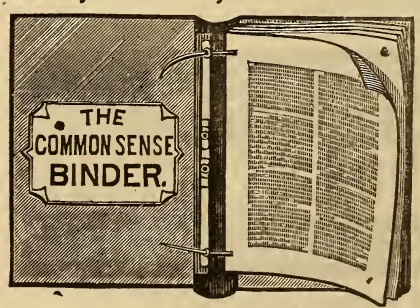
Sent by Mail on Receipt of 75 Cents.

ADDRESS. **Drs. RANDOLPH & DULLES,**

P. O. Box 843. PHILADELPHIA, PA.

BIND YOUR REPORTER.

If any of our readers will buy a binder, such as is represented in the accompanying illustration, and put their numbers of the MEDICAL AND SURGICAL REPORTER in it, week by week, we think they will find it so satisfactory that they will thank us for suggesting the plan to them.



The way to do the work is very simple: Free the points; lay the journal down with its back to them so as to correspond to the sides of the binder; make a mark with a lead pencil where each point touches the back of the journal; pierce a hole with a strong penknife; and slip the points through them. Then close them down. Try it. Each binder will hold one volume, (26 numbers) of the REPORTER.

Such binding will save the trouble of having the REPORTER bound permanently at the end of the year. But it will not prevent it, if any one desires it. Price, 75 Cents.

Address, Drs. RANDOLPH & DULLES,

P. O. Box 843. **PHILADELPHIA, PA.**

SPECIFY (BATTLE) WHEN PRESCRIBING OUR PREPARATIONS.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

THE MEDICAL AND SURGICAL REPORTER

Established 1853.

Aims to meet the average wants of the medical man, and to be interesting, instructive and clear, so as to be useful to the practitioner, rather than the laboratory student. Contains careful Reviews of New Books, Abstracts of the best Medical Journals all over the World, Items of News, and EDITORIALS prepared with especial regard to the good of its readers and the interest of the profession. It aims to be dignified; but not TOO SERIOUS, and to cultivate friendly and pleasant relations with all its readers.

Since May 1st, 1887, material improvements have been made in its appearance and character; and a liberal policy has been adopted toward its contributors and subscribers, which both have appreciated. We are happy to say that the subscription list is enlarging in a gratifying way. But we hope for a larger increase still. Price $5 a year. Any old subscriber sending a new name, with the money, may retain $2.00 of the amount.

TREATMENT OF CONSUMPTION.

A Simplified Apparatus for the preparation and introduction of gases into the bowel (according to Dr. Bergeon's method) by Dr. H. N. Bryan, of Philadelphia.

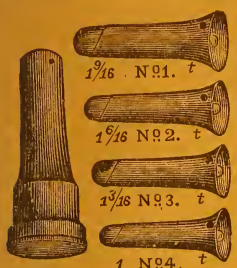
This Apparatus has advantages which others do not possess, and being considerably lower in price than any devised for a similar purpose, it should commend itself to the favorable consideration of the medical profession. An illustrated descriptive circular sent to any address, on application.

Price of Apparatus, complete, in a neat portable Telescopic Case with Handle, **$6.00.**

Sample Card of the Iron-Dyed Silk (14 sizes) will be sent to any address on application. Price Per Reel, - 10 cts.

WILLIAM SNOWDEN,
Manufacturer, Importer and Exporter of Surgical Instruments,
No. 7 South Eleventh St., Philadelphia.

STAUFER'S
HARD RUBBER SPECULUMS GUARANTEED.



Prices, Single, $2.50
Series encased, 12.00

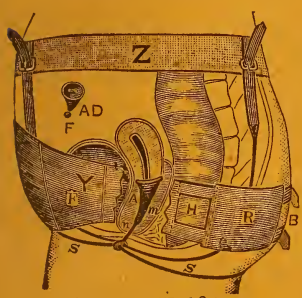
The engraving shows the shape, conductor and case so complete, that scarcely any description is necessary. For compactness there is but one conductor stem, on which each size of bulb screws. Speculums and case are all of the best quality hard rubber, and do not break from ordinary falling. Dental red enamelled inside. The mouth is polished very smooth, and shaped so that the cervix can be brought in entirely by rotation. And when brought in can be rotated to bring into view all the parts. The vaginal portion of the uterus can be seen as clearly as if located externally. When obtained, single, No. 2, is the most useful, since it reveals fully the point of the cervix in almost all multipara, and freely enters, when the position is correct, in many nullipara.

Guarantee.—One or two speculums are guaranteed; thus when returned sound and in the original wooden boxes, within six months of purchase, the money will be refunded without any deduction.

Plates.—The *First* contains 16 engravings and groups of engravings, illustrating the uterine examining instruments. *Second* contains 17 engravings and groups of engravings, illustrating the uterine replacing and supporting instruments.

Catalogue.—The catalogue comprises over 150 sizes and styles of uterine examining and supporting instruments, of which the hard rubber parts are exchanged and interchanged at cost, without limit of time. It also contains full directions and explanations for the use of this series of hard rubber gynecological instruments; together with common information collected through many years to simplify this line of treatment.

STAUFER'S
SPRING STEM UTERINE SUPPORTERS.
GUARANTEED.



Price, on Y, $6.00
" " Z, 5.00

The engraving shows the Spring Stem Cup, which consists of over a dozen sizes. The series contains Spring Stem Balls, Spring Stem Levers, for Anteversions and Retroversions. also Spring Stem Cup with posterior projections, all of assorted sizes.

Explanation.—The stem is screwed on cup A, and when unscrewed, the spring is put in tube *m*, or taken out when it needs cleaning. Thus the coil spring lays between the cup and base *n*. When there is pressure from above, or below, or both, the spring is compressed and again stretches out at the first opportunity. The movement of the base stem *n*, is governed by a slot and pin through tube *m*.

A D.—Represents the cup transformed into a self-sustaining cup, virtually an instrument of double capacity. In most cases after the uterus is held in "health line" for a time by external support, contraction of the walls of the vagina takes place, and it is sufficient at night or until forced down next day by bodily exertion, against which the stem and bandage guards if applied in time.

Belt Y.—The manner in which belt Y, sets on the abdomen is shown in above engraving. The widest or lifting part is in front. Over each hip as seen at H, are two elastics, and on large belts three. It closes on the back by buckling at B. It is of fine sateen outside, fine lining inside, and a slight stiffening between, and stayed with soft whalebones. Accurate hip measure is to be taken over a thin undergarment; since it needs to fit with a space of one or two inches apart on the back, for the buckle straps to draw. The perineal attachments are short and buckle at F and R.

Belt Z.—This is an elastic waist strap and carries any supporter of this series. Yet the common difficulty presents itself, where long and slender attachments are used, that they do not govern the internal part so efficiently as on the low grasping abdominal supporter Y.

The Series.—This series of imstruments has been invented as cases presented themselves, requiring different styles and sizes of instruments, without change of proprietor, until it has reached its present efficiency.

Guarantee.—The money lost by purchasing uterine supporters, unscientifically constructed, of irritating material, or limited in deficiency of sizes, and in consequence loss of families in practice, has set a large portion of the medical profession against the mechanical support of the uterus. By these conditions the risk of the first purchase by a physician of a stem and bandage supporter of this series is obviated. After the first purchase the instruments are supposed to be known, yet the guarantee is extended by special contract in doubtful cases.

Refunding.—On return of the hard rubber part or parts within six months of purchase, Four Dollars of the purchase money will be refunded. The belt remains with the patient as an abdominal supporter and only risk.

The above Guarantee and Refunding is secured when the Instrnments are obtained through this Office. Any other Instrument of STAUFER'S SERIES is also obtained through this Office at Catalogue Prices, and Catalogue free, on application.

☞Subscribers to the MEDICAL AND SURGICAL REPORTER or the COMPENDIUM OF MEDICAL SCIENCE, whose subscriptions expired on or before January 1, 1888, are requested to remit the amount of their indebtedness at as early a date as possible to the Publishers,

DRS. RANDOLPH & DULLES,

PHILADELPHIA.

P. O. Box 843.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recemmended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

—SPECIAL FORMULÆ TO ORDER.—

Avoid Cheap Imitations by Always Specifying "SEABURY'S" or "S. & J."

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. INDISPENSABLE AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS

DARK — A NON-ALCOHOLIC LIQUID. — WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

Samples FREE to any Physician who will pay Express charges, and mention this Journal.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

An Invaluable Aid in the Treatment of all Cases of Debility.

☞ ESTABLISHED 15 YEARS. ☞ ENDORSED BY SCORES OF PHYSICIANS. ☞ BEWARE OF IMITATIONS.

☞ ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, Soluble Citrate of Iron, Cinchona, Gentian, and simple aromatics. An official analysis of this preparation by the eminent chemist, ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement of by Sir ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

In the treatment of all cases of Debility, Convalescence from severe illness, Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Lack of Nerve Tone, and of the Alcohol and Opium Habits, and all maladies requiring a Tonic Nutrient, it is superior to all other preparations.

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion, and gives to weakened individuals that first prerequisite to improvement, an appetite.—By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label WITH IRON, "No. 1;" while the same preparation, WITHOUT IRON, is designated on the label as "No. 2."

☞ *I will, upon application, send a sample bottle of* COLDEN'S LIQUID BEEF TONIC *to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S," viz., "EXT. CARNIS FL. COMP. (COLDEN)." It is put up in pint bottles, and* CAN BE HAD OF WHOLESALE AND RETAIL DRUGGISTS GENERALLY THROUGHOUT THE UNITED STATES.

C. N. CRITTENTON, Sole Agent, 115 Fulton Street, New York.

GLENN'S SULPHUR SOAP.

All physicians know the great value of the local use of Sulphur in the TREATMENT OF DISEASES OF THE SKIN. GLENN'S SULPHUR SOAP is the ORIGINAL and BEST combination of its kind, and the one now generally used. For sale by all Druggists at 25 cents a cake, or three cakes for 60 cents. Beware of counterfeits.

CONSTANTINE'S PINE TAR SOAP.

BY FAR THE BEST TAR SOAP MADE. Has been on trial among physicians for very many years as a toilet soap and healing agent, and its superior virtues have been unanimously conceded in ALL CASES WHERE THE USE OF TAR IS INDICATED.

Unsolicited expressions of its excellence have been received from the Medical Faculty generally. None genuine unless stamped "A. A. Constantine's Persian Healing Pine Tar Soap." For sale by all Druggists.

Wholesale Depot, C. N. CRITTENTON, 115 Fulton Street, New York.

Please mention this Journal. ☞ Samples of above Soaps SENT FREE on application to any physician enclosing card.

St. Louis College of Physicians and Surgeons.

The Ninth Academical year begins on September 1st and terminates on the last Saturday of May prox., comprising preliminary, regular and spring courses. The first and third optional. The regular session opens on the second Monday of October, continuing twenty weeks. The spring course offers all the opportunities of post-graduate instruction, inclusive of dissection, operations on cadaver, etc. Licensed practitioners by examination before Examining Boards or Boards of Health admitted to the graduating class. *Ad Eundem* degrees granted to graduates of two years standing by attending portion of regular course, and passing practical examination.

Fees for Academical Year,	**$50.00.**
Matriculation,	**5.00, paid but once.**
Graduation Examination,	**25.00, not returnable.**

Abundant anatomical material at nominal prices for anatomical, pathological and operative pursuits. Abundant clinical material in all branches, inclusive. Practical obstetrics.

For announcement and particulars, apply to

NEW AND RELIABLE RECIPES FOR PHYSICIANS PRESCRIBING.

In order to get the full therapeutic effects, physicians will please specify (WARNER & Co.) when ordering or prescribing.

☞The coating of the following pill will dissolve in 4½ minutes.☜

Pil: Chalybeate Comp.

(WARNER & CO.)

Nux Vomica is added as an ingredient to Pill Chalybeate to increase the tonic effect when desired.

Composition of each Pill.—℞ (Chalybeate Mass.), Carb. Protoxide of Iron, gr. 2½., Ext. Nuc. Vom. gr. 1-6.

DOSE—1 to 3 Pills.

Most advantageously employed in the treatment of Anæmia, Chlorosis, Phthisis, Scrofula, Loss of Appetite, etc.

Pil: Antiseptic Comp.

(WARNER & CO.)

Each Pill contains: Sulphite Soda, 1 gr. Salicylic Acid, 1 gr. Ext. Nuc. Vomica, ⅛ gr. Powd. Capsicum, 1-10 gr. Conc't Pepsin, 1 gr.

DOSE—1 to 3 Pills.

Pil. Antiseptic Comp. are prescribed with great advantage in cases of Dyspepsia, Indigestion, and malassimilation of food.

Pil: Antiseptic.

Each Pill contains: Sulphite Soda, 1 gr. Salicylic Acid, 1 gr. Ext. Nuc. Vomica, ¼ gr.

DOSE.—1 to 3 Pills.

Pil. Antiseptic is prescribed with great advantage in cases of Dyspepsia attended with acid stomach and enfeebled digestion following excessive indulgence in eating or drinking. It is used with advantage in Rheumatism.

Prepared by WM. R. WARNER & CO.

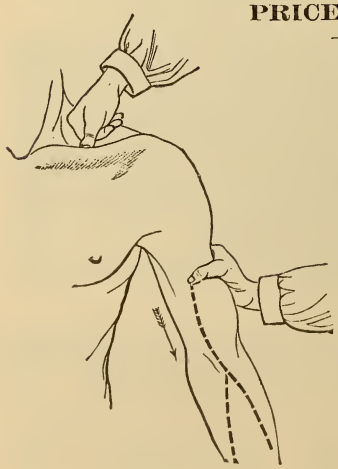
Supplied upon physician's prescription by all leading druggists.

ACCIDENTS AND EMERGENCIES.

BY CHARLES W. DULLES, M.D.,

SECOND EDITION, REVISED AND ENLARGED, WITH NEW ILLUSTRATIONS.

PRICE, - - - - 75 CENTS.



"It is a book which no family ought to be without."—*Boston Herald.*

A good book to recommend to the Heads of Families.

☞ "Contains directions for taking care of persons who have been injured by machinery, of the apparently drowned and suffocated, how to stop bleeding from wounds, how to treat sunstroke, burns, scalds, exhaustion, all sorts of fits and seizures, sprains, earache, toothache, etc., pains and emergencies that must be looked after at once, before the arrival of the doctor, and hints useful to doctors themselves. Also proper remedies to keep in the house, their effects and uses, etc."

"The instructions in regard to the treatment of injuries and sudden illnesses are thoroughly practical, and the suggestions for supplies for emergencies are especially useful."—*New York Tribune.*

"It ought to be read once or twice each year."—*St. Louis Medical and Surgical Journal.*

Sent by Mail on Receipt of 75 Cents.

ADDRESS. **Drs. RANDOLPH & DULLES,**

P. O. Box 843. PHILADELPHIA, PA.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of **considerably greater strength** and **efficacy** than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—**Prof. SEEGEN.**

"After twenty years' use I appreciate it as highly as ever."—

Prof. VIRCHOW.

BUFFALO LITHIA WATER

FOR GOUTY RHEUMATIC AND RENAL AFFECTIONS.

ROBERTS BARTHOLOW, M. A., M. D., LL.D., Prof. of Materia Medica and General Therapeutics in the Jefferson Medical College of Philadelphia. See his "Materia Medica and Therapeutics,"
"Buffalo Lithia Spring of Virginia contains well-defined traces of Lithia, and is Alkaline. This has been used with great advantage in Gouty, Rheumatic and Renal Affections," * * * * * * "There is little doubt that the continuous use of Alkaline Waters for a long period will cause the solution of Uric Acid Renal Calculi, For this purpose those Alkaline Waters rich in POTASSA are preferable."

This water has a large percentage of the CARBONATE OF POTASSA, making it rich in valuable Alkali.

Dr. Wm. A. Hammond, of New York, Surgeon-General U. S. Army, (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the Nervous System complicated with Bright's Disease of the Kidneys, or with a Gouty Diathesis. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the Buffalo Water certainly acts better than any extemporaneous solution of the Lithia Salts, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of Cerebral Hyperæmia, resulting from over mental work—in which the condition called Nervous Dyspepsia exists—and generally with marked benefit."

Dr. Robert Battey, of Georgia, Suggester of Battey's Operation, Member of the American Medical Association, etc.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of Chronic Inflammation of the Bladder, whether induced by Stone, by Enlarged Prostate in the aged, or by Neglected Gonorrhœa, and have secured excellent results, which encourages me to prescribe it for the future."

Dr. Hunter McGuire, Richmond, Virginia, late Professor of Surgery, Medical College of Virginia.

"Buffalo Lithia Water, Spring No. 2, as an Alkaline Diuretic, is invaluable. In Uric Acid Gravel, and, indeed, in diseases generally dependent upon a Uric Acid Diathesis, it is a remedy of extraordinary potency I have prescribed it in cases of Rheumatic Gout, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. Alfred L. Loomis, of New York, Professor of Institutes and Practice of Medicine, Medical Department University of New York.

"For the past four years I have used the Buffalo Lithia Water in the treatment of Chronic Interstitial Nephritis occurring in Gouty and Rheumatic subjects, with the most marked benefit. In all Gouty and Rheumatic Affections I regard it as highly efficacious."

Dr. Harvey L. Byrd, of Baltimore, President and Professor of Obstetrics and Diseases of Women and Children, in the Baltimore Medical College, formerly Professor of Practical Medicine, etc.

"I have witnessed the best results from the action of the Buffalo Lithia Water, Spring No. 2, in Chronic Gout, Rheumatic Gout, Rheumatism, Gravel, and Stone in the Bladder, and I do not hesitate to express the opinion that all diseases depending upon or having their origin in Uric Acid Diathesis, it is unsurpassed, if, indeed, it is equaled by any water thus far known to the profession.

"It has an ascertained value in Bright's Disease. A knowledge of its action in that disease thus far would seem to warrant the belief that it would, in many instances, at least in its early stages, arrest it entirely; and in its more advanced stages prove a decided comfort and palliative."

Water, in cases of one dozen half gallon bottles, $5.00 per case, at the Springs. Testimonials sent free on application. The Virginia Buffalo Lithia Springs Company have no longer control of the water. To get it **FRESH** order directly of or from parties who deal directly with

<THOMAS F. GOODE, Prop., Buffalo Lithia Springs, Va.>

WATER FOR SALE BY

FRED. BROWN, or J. F. HAYES, Philadelphia.

MALTINE.

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms, is the only Malt Preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides and the Iodides.

It deserves to stand in the front rank of constructives; and the constructives by their preventive, corrective, and curative power, are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may often be resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan and Dimmock, *only three* possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. R. H. CRITTENDEN, *Professor of Physiological Chemistry in Yale College.*

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe; and recent analysis made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other Malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	**MALTINE** with Peptones.	**MALTINE** Ferrated.
MALTINE with Alteratives.	**MALTINE** with Pepsin & Pancreatine	**MALTO-YERBINE.**
MALTINE with Cod Liver Oil.	**MALTINE** with Phosphates, Iron Quinine and Strychnia.	**MALTO-VIBURNIN.**
MALTINE with Hypophosphites.		**MALTINE** with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "MALTINE" should be written, and not simply the words "Malt Extract" or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply the regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

The Maltine Manufacturing Co.,

Laboratory, Yonkers-on-Hudson. **182 Fulton Street, New York.**

THE BEST PREPARATION OF COD LIVER OIL.

Of the very many flattering testimonials to the value of

CASWELL, MASSEY & CO.'S

EMULSION OF COD LIVER OIL

WITH PEPSIN AND QUININE,

none has afforded the firm more pleasure than the following from Professor LOOMIS:

"19 West 34th Street, New York.

"I have used Caswell & Massey's Emulsion of Cod Liver Oil with Pepsin and Quinine for the past nine years, and it has given me greater satisfaction than any other preparation of Cod Liver Oil that I have used. I can most cheerfully recommend it to my professional brethren.

"ALFRED L. LOOMIS, M.D."

WYETH'S LIQUID MALT EXTRACT.

CONTAINING ALL THE NUTRITIVE PROPERTIES OF MALT, WITH THE LEAST POSSIBLE AMOUNT OF ALCOHOL.

We claim that our Liquid Malt Extract will be found to contain all the nutritive virtues of the best malt-liquors in a higher degree than any of the largely sold liquid malts with which we have compared it, while it is free from the stimulating effect which invariably follows their administration.

This is not a beverage, but a most agreeable and valuable nutrient, tonic and digestive agent, containing a large amount of nutritious extractive matter and the smallest percentage of alcohol found in any liquid preparation of malt. Since the introduction of this preparation to the medical profession, about two years ago, it has steadily grown in favor, and those who have given the subject of malt extracts the most careful study and investigation, are unanimous in endorsing all the claims we have made for it.

It is especially adapted for administration to nursing mothers and children, to patients suffering from nervous exhaustion, chilliness, and particularly to those unable to digest starchy food.

The diastase contained in our preparation of malt renders such foods immediately soluble, by converting the starch into malt-sugar and dextrine, in which form they can be readily assimilated by the system, thus *creating* animal heat, and aiding the formation of fat.

Probably its greatest value is during lactation, as it not only supplies strength to meet the unusual demands upon the system at that time, but it improves the quality of the milk, by increasing the amount of sugar and phosphates, nourishing the infant and sustaining the mother at the same time.

As it contains less than three per cent. of alcohol, it can be given to invalids, children, etc., without danger of the secondary depressant effect so frequently experienced from the administration of spirituous remedies; the ordinary dose of a wineglassful representing less than forty grains of alcohol and over one hundred and twenty-five grains of nutritious extractive matter, rich in diastase, preserved by our peculiar process of preparation; while in the malt-liquors it is rendered completely inert by the boiling to which they are subjected during manufacture.

Complete lists, with prices, etc., of all of our preparations will be sent by mail on application. (Specify **WYETH'S** when ordering.)

JOHN WYETH & BROTHER, Chemists,

PHILADELPHIA.

SUCCUS ALTERANS

(McDADE.)

SUCCUS ALTERANS is a purely vegetable compound of the preserved juices of Stillingia Sylvatica, Lappa Minor, Phytolacca Decandra, Smilax Sarsaparilla and Xanthoxylum Carolinianum, as collected by Dr. Geo. W. McDade exclusively for Eli Lilly & Co., and endorsed by Dr. J. Marion Sims.

SUCCUS ALTERANS continues to gain favor from its remarkable Alterative and Tonic properties, *eliminating specific poison from the blood* and *increasing the proportion of red corpuscles in anæmic patients* to a wonderful degree; is endorsed by the medical profession and in use by many hospitals of note.

SUCCUS ALTERANS in venereal and cutaneous diseases is fast supplanting Mercury, the Iodides and Arsenic; and is a certain remedy for Mercurialization, Iodism and the dreadful effects often following the use of Arsenic in skin diseases.

SUCCUS ALTERANS is also strongly recommended for its Tonic and Alterative effects in myriad forms of scrofulous disease, and in all cases where anæmia is a factor. Such patients rapidly develop a good appetite, sleep soundly and gain flesh rapidly. Many cases are on record where patients increased ten to twenty-five pounds in weight in a few weeks.

SUCCUS ALTERANS is giving satisfactory results in treatment of *Chronic Rheumatism* and can be used with confidence.

SUCCUS ALTERANS may be given for any length of time, without injury to the patient.

SUCCUS ALTERANS is put up in pint round amber bottles and *never in bulk.*

PHYSICIANS who have not received Dr. McDade's latest publication, the Monographia Syphilitica, should send their address, mentioning this journal, and we will mail a copy. It contains a paper, illustrated with colored plates, by Dr. D. H. Goodwillie, of New York, on the "Sequelæ of Syphilis," reports of cases in practice and many other valuable papers.

ELIXIR PURGANS.

Elixir Purgans (Lilly) reliably stimulates the dormant liver without undue irritation, and has gentle yet positive effect upon the alimentary tract. In Habitual Constipation, so common in Women and Children, it will be found particularly useful. Its endorsement at Bellevue and many other prominent hospitals East and West, as well as its employment in general practice by the most eminent medical men, confirms the experience of years in its use.

Each Teaspoonful Represents	
Rhamnus Purshiana, -	10 grs.
Euonymus Atropur., - -	8 grs.
Cassia Acutifolia (Purif.) -	10 grs.
Iris Versicolor, - - -	4 grs.
Hyoscyamus Niger, - -	2 grs.
Aromatics, etc.	

IN PRESCRIBING, PLEASE BE CAREFUL TO WRITE

ELIXIR PURGANS (LILLY),

THAT OTHER PREPARATIONS MAY NOT BE SUBSTITUTED.

HIGHLY RECOMMENDED.

We take pleasure in endorsing the Elixir Purgans (Lilly) as prepared from the above formula, for in it we find a near approach to positive *perfection* in the form of a *Liquid Cathartic*, and, from our experience with the preparation, can highly recommend it to the profession.

ELI LILLY & CO., **Pharmaceutical Chemists, Indianapolis, Ind., U. S. A.**

SUPPLIED BY ALL DRUGGISTS.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. **INDISPENSABLE** AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS
DARK A NON-ALCOHOLIC LIQUID. WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

SPECIFY (BATTLE) WHEN PRESCRIBING OUR PREPARATIONS.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

THE MEDICAL AND SURGICAL REPORTER

Established 1853.

Aims to meet the average wants of the medical man, and to be interesting, instructive and clear, so as to be useful to the practitioner, rather than the laboratory student. Contains careful Reviews of New Books, Abstracts of the best Medical Journals all over the World, Items of News, and EDITORIALS prepared with especial regard to the good of its readers and the interest of the profession. It aims to be dignified; but not TOO SERIOUS, and to cultivate friendly and pleasant relations with all its readers.

Since May 1st, 1887, material improvements have been made in its appearance and character; and a liberal policy has been adopted toward its contributors and subscribers, which both have appreciated. We are happy to say that the subscription list is enlarging in a gratifying way. But we hope for a larger increase still. Price $5 a year. Any old subscriber sending a new name, with the money, may retain $2.00 of the amount.

Address Drs. RANDOLPH & DULLES,
P. O. BOX, 843. PHILADELPHIA.

MEDICAL DEPARTMENT—PHILADELPHIA.

PROFESSORS: Joseph Leidy, R. A. F. Penrose, D. Hayes Agnew, William Pepper, William Goodell, James Tyson, H. C. Wood, Theo. G. Wormley, John Ashhurst, Jr., William Osler, Edw. T. Reichert, Wm. F. Norris, Geo. Strawbridge, Louis A. Duhring, Louis Starr, Edw. T. Bruen, J. William White.

The 122d Annual Winter Session will commence Monday, October 3, 1887, and continue 7 months.

The Preliminary Course will begin Monday, Sept. 19.

Graded Curriculum.—Three Winter Sessions required. Voluntary fourth year.

Practical Instruction in all departments.

For particulars see catalogue, for which address,

JAMES TYSON, M.D., Sec'y

After Forty years' experience in the preparation of more than One Hundred Thousand applications for patents in the United States and Foreign countries, the publishers of the Scientific American continue to act as solicitors for patents, caveats, trade-marks, copyrights, etc., for the United States, and to obtain patents in Canada, England, France, Germany, and all other countries. Their experience is unequaled and their facilities are unsurpassed.

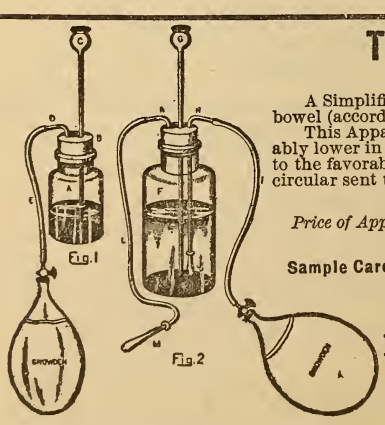
Drawings and specifications prepared and filed in the Patent Office on short notice. Terms very reasonable. No charge for examination of models or drawings. Advice by mail free.

Patents obtained through Munn & Co. are noticed in the **SCIENTIFIC AMERICAN**, which has the largest circulation and is the most influential newspaper of its kind published in the world. The advantages of such a notice every patentee understands.

This large and splendidly illustrated newspaper is published **WEEKLY** at $3.00 a year, and is admitted to be the best paper devoted to science, mechanics, inventions, engineering works, and other departments of industrial progress, published in any country. It contains the names of all patentees and title of every invention patented each week. Try it four months for one dollar. Sold by all newsdealers.

If you have an invention to patent write to Munn & Co., publishers of Scientific American, 361 Broadway, New York.

Handbook about patents mailed free.



TREATMENT OF CONSUMPTION.

A Simplified Apparatus for the preparation and introduction of gases into the bowel (according to Dr. Bergeon's method) by Dr. H. N. Bryan, of Philadelphia.

This Apparatus has advantages which others do not possess, and being considerably lower in price than any devised for a similar purpose, it should commend itself to the favorable consideration of the medical profession. An illustrated descriptive circular sent to any address, on application.

Price of Apparatus, complete, in a neat portable Telescopic Case with Handle, **$6.00.**

Sample Card of the Iron-Dyed Silk (14 sizes) will be sent to any address on application. Price Per Reel, - 10 cts.

ACCIDENTS AND EMERGENCIES.

BY CHARLES W. DULLES, M.D.,

SECOND EDITION, REVISED AND ENLARGED, WITH NEW ILLUSTRATIONS.

PRICE, - - - - 75 CENTS.

"It is a book which no family ought to be without."—*Boston Herald.*

A good book to recommend to the Heads of Families.

☞ "Contains directions for taking care of persons who have been injured by machinery, of the apparently drowned and suffocated, how to stop bleeding from wounds, how to treat sunstroke, burns, scalds, exhaustion, all sorts of fits and seizures, sprains, earache, toothache, etc., pains and emergencies that must be looked after at once, before the arrival of the doctor, and hints useful to doctors themselves. Also proper remedies to keep in the house, their effects and uses, etc."

"The instructions in regard to the treatment of injuries and sudden illnesses are thoroughly practical, and the suggestions for supplies for emergencies are especially useful."—*New York Tribune.*

"It ought to be read once or twice each year."—*St. Louis Medical and Surgical Journal.*

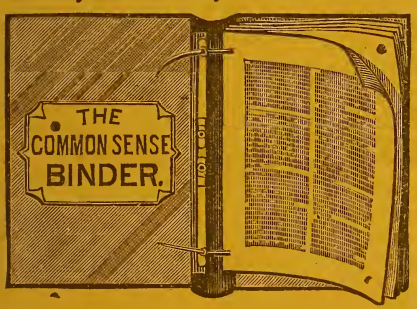
Sent by Mail on Receipt of 75 Cents.

ADDRESS. **Drs. RANDOLPH & DULLES,**

P. O. Box 843. PHILADELPHIA, PA.

BIND YOUR REPORTER.

If any of our readers will buy a binder, such as is represented in the accompanying illustration, and put their numbers of the MEDICAL AND SURGICAL REPORTER in it, week by week, we think they will find it so satisfactory that they will thank us for suggesting the plan to them.



The way to do the work is very simple: Free the points; lay the journal down with its back to them so as to correspond to the sides of the binder; make a mark with a lead pencil where each point touches the back of the journal; pierce a hole with a strong penknife; and slip the points through them Then close them down. Try it. Each binder will hold one volume, (26 numbers) of the REPORTER.

Such binding will save the trouble of having the REPORTER bound permanently at the end of the year. But it will not prevent it, if any one desires it. Price, 75 Cents.

Address, Drs. RANDOLPH & DULLES,

P. O. Box 843. PHILADELPHIA, PA.

QUARTERLY COMPENDIUM OF MEDICAL SCIENCE.

Subscribers to the **MEDICAL AND SURGICAL REPORTER** can obtain a very valuable supplement to it at a very low rate. **THE QUARTERLY COMPENDIUM OF MEDICAL SCIENCE** comprises four numbers a year, about 150 octavo pages each, of Careful Selections and Translations from the best American and Foreign Medical Journals.

The Selections are **NOT DUPLICATES** of what appears in the **REPORTER**, but **DISTINCT AND INDEPENDENT ONES**, most of them being longer than we care to put in the **REPORTER**.

The four numbers of The Compendium are sent to our subscribers for the nominal rate of $1.00 per year. To non-subscribers the price is $2.50 a year.

EVERY READER OF THE REPORTER OUGHT TO TAKE THE COMPENDIUM.

The January number is better printed and handsomer than any before it. Send for specimen.

Address:

DRS. RANDOLPH & DULLES,

P. O. Box 843. **Philadelphia.**

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

SEABURY & JOHNSON, New York and London,

AND OTHER ANTISEPTIC TABLETS;
SEABURY'S HYDRONAPHTHOL, SALICYLIC AND BORACIC TOILET SOAPS;
HYDRONAPHTHOL PASTILLES AND SULPHUR CANDLES.

—ALSO A FULL LINE OF—

Medicinal and Surgical Plasters, Absorbent Cottons, Lint and Gauze, plain or with any desired dication; Ligatures, Silk and Rubber Protectives; Plaster Paris Bandages; Lamb's Wool, Paper Wood-Wool; and Surgical Dressings, Plasters and Antiseptics of every description.

—SPECIAL FORMULÆ TO ORDER.—

Avoid Cheap Imitations by Always Specifying "SEABURY'S" or 'S. & J."

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞ Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. **INDISPENSABLE** AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS

DARK — A NON-ALCOHOLIC LIQUID. — WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

RIO CHEMICAL CO., ST. LOUIS: LONDON: PARIS.

Samples FREE to any Physician who will pay Express charges, and mention this Journal.

HYDROLEINE

(HYDRATED OIL)

FOR CONSUMPTION and WASTING DISEASES,

Produces Immediate Increase in Flesh and Weight.

FORMULA.

Each Dose of Two Teaspoonfuls equal to 120 Drops, contains:

Pure Cod Liver Oil...80 m. (drops)	Soda.....1.3 Grains.
Distilled Water.....35 "	Salicylic Acid.....1.4 "
Soluble Pancreatin.. 5 Grains.	Hyocholic Acid.....1.20 "

DOSE.—Two teaspoonfuls alone, or with twice the quantity of water to be taken thrice daily after meals.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhua, but a hydro-pancreated preparation containing acids and a modicum of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used completely saponifies the oleaginous material so necessary to the reparative process in all wasting diseases.

Each bottle in nutritive value exceeds ten times the same bulk of cod liver oil. It is economical in use and certain in results.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," by H. C. BARTLETT, Ph.D., F. C. S., *and the experiments which were made, together with cases illustrating the effect of Hydrated Oil in practice, are concisely stated in a Treatise on "Consumption and Wasting Diseases," by* G. OVEREND DREWRY, M.D. *Copies of these works sent free on application.*

SOLD AT ALL DRUG STORES, AT $1.00 PER BOTTLE.

C. N. CRITTENTON,

Sole Agent for the United States. 115 FULTON ST., NEW YORK.

A sample of Hydroleine will be sent free upon application, to any physician (inclosing business card) in the United States.

St. Louis College of Physicians and Surgeons.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of **considerably greater strength** and **efficacy** than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—**Prof. SEEGEN.**

"After twenty years' use I appreciate it as highly as ever."—

Prof. VIRCHOW.

PROFESSORS: Joseph Leidy, R. A. F. Penrose, D. Hayes Agnew, William Pepper, William Goodell, James Tyson, H. C. Wood, Theo. G. Wormley, John Ashhurst, Jr., William Osler, Edw. T. Reichert, Wm. F. Norris, Geo. Strawbridge, Louis A. Duhring, Louis Starr, Edw. T. Bruen, J. William White.

The 122d Annual Winter Session will commence Monday, October 3, 1887, and continue 7 months.

The Preliminary Course will begin Monday, Sept. 19.

Graded Curriculum.—Three Winter Sessions required. Voluntary fourth year.

Practical Instruction in all departments.

For particulars see catalogue, for which address,
JAMES TYSON, M.D., Sec'y

FELLOWS'

HYPO-PHOS-PHITES

(SYR: HYPOPHOS: COMP: FELLOWS)

Contains **The essential elements** to the Animal Organization—Potash and Lime.

The **Oxydizing Agents**—Iron and Manganese;

The **Tonics**—Quinine and Strychnine;

And the **Vitalizing Constituent**—Phosphorus,

Combined in the form of a Syrup, with *slight alkaline reaction.*

It Differs in Effect from all others, being pleasant to taste, acceptable to the stomach, and harmless under prolonged use.

It has Sustained a High Reputation in America and England for efficiency in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs, and is employed also in various nervous and debilitating diseases with success.

Its Curative Properties are largely attributable to Stimulant, Tonic, and Nutritive qualities, whereby the various organic functions are recruited.

In Cases where innervating constitutional treatment is applied, and tonic treatment is desirable, this preparation will be found to act with safety and satisfaction.

Its Action is Prompt; stimulating the appetite and the digestion, it promotes assimilation, and enters directly into the circulation with the food products.

The Prescribed Dose produces a feeling of buoyancy, removing depression or melancholy, and hence is of great value in the treatment of MENTAL AND NERVOUS AFFECTIONS.

From its exerting a double tonic effect and influencing a healthy flow of the secretions, its use is indicated in a wide range of diseases.

Prepared by JAMES I. FELLOWS, Chemist,

48 VESEY STREET, NEW YORK.

QUARTERLY COMPENDIUM OF MEDICAL SCIENCE.

Subscribers to the MEDICAL AND SURGICAL REPORTER can obtain a very valuable supplement to it at a very low rate. THE QUARTERLY COMPENDIUM OF MEDICAL SCIENCE comprises four numbers a year, about 150 octavo pages each, of Careful Selections and Translations from the best American and Foreign Medical Journals.

The Selections are NOT DUPLICATES of what appears in the REPORTER, but DISTINCT AND INDEPENDENT ONES, most of them being longer than we care to put in the REPORTER.

The four numbers of The Compendium are sent to our subscribers for the nominal rate of $1.00 per year. To non-subscribers the price is $2.50 a year.

EVERY READER OF THE REPORTER OUGHT TO TAKE THE COMPENDIUM.

The January number is better printed and handsomer than any before it. Send for specimen.

Address:

DRS. RANDOLPH & DULLES,

P. O. Box 843. Philadelphia.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. **INDISPENSABLE** AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS

DARK — A NON-ALCOHOLIC LIQUID. — WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

RIO CHEMICAL CO., ST. LOUIS: LONDON: PARIS.

Samples FREE to any Physician who will pay Express charges, and mention this Journal.

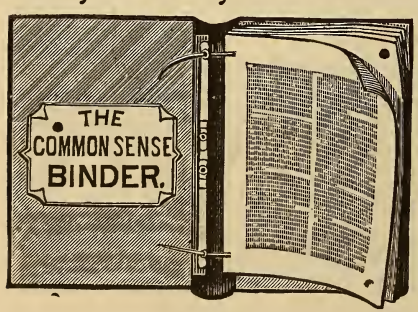
BIND YOUR REPORTER.

If any of our readers will buy a binder, such as is represented in the accompanying illustration, and put their numbers of the MEDICAL AND SURGICAL REPORTER in it, week by week, we think they will find it so satisfactory that they will thank us for suggesting the plan to them.



The way to do the work is very simple: Free the points; lay the journal down with its back to them so as to correspond to the sides of the binder; make a mark with a lead pencil where each point touches the back of the journal; pierce a hole with a strong penknife; and slip the points through them Then close them down. Try it. Each binder will hold one volume, (26 numbers) of the REPORTER.

Such binding will save the trouble of having the REPORTER bound permanently at the end of the year. But it will not prevent it, if any one desires it. Price, 75 Cents.

Address, Drs. RANDOLPH & DULLES,

P. O. Box 843. PHILADELPHIA, PA.

Mellin's Food.

PROF. DR. R. FRESENIUS, of Wiesbaden, Germany,

says:—"MELLIN'S FOOD contains 72.56 per cent. of carbohydrates; 9.75 per cent. of albuminoids; 4.37 per cent. of salts; and 13.32 per cent. of moisture. *Starch none; cane sugar none.*"

DR. A. STUTZER, of Bonn, Germany,

says:—"MELLIN'S FOOD, prepared with milk according to the directions accompanying it, perfectly fulfils every requisite of a food for infants. *Starch and cane sugar are entirely absent.*"

G. W. WIGNER, F.I.C., F.C.S., London, England,

President of the Society of Public Analysts,

says:—"MELLIN'S FOOD is not a mere starch or sugar food, like so many that are now sold, but it is a soluble preparation containing proper proportions of those nitrogenous and phosphatic matters which are essential for the health and growth of a child, but are not easily obtained in the prepared foods as usually sold."

These are the foremost chemists of the world, and it must be admitted that the correctness of their analyses is beyond question.

A sample of MELLIN'S FOOD, sufficient for trial, will be sent to any physician upon application.

Doliber, Goodale & Co., Boston, Mass.

SPECIFY (BATTLE) WHEN PRESCRIBING OUR PREPARATIONS.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

QUARTERLY COMPENDIUM OF MEDICAL SCIENCE.

Subscribers to the MEDICAL AND SURGICAL REPORTER can obtain a very valuable supplement to it at a very low rate. THE QUARTERLY COMPENDIUM OF MEDICAL SCIENCE comprises four numbers a year, about 150 octavo pages each, of Careful Selections and Translations from the best American and Foreign Medical Journals.

The Selections are NOT DUPLICATES of what appears in the REPORTER, but DISTINCT AND INDEPENDENT ONES, most of them being longer than we care to put in the REPORTER.

The four numbers of The Compendium are sent to our subscribers for the nominal rate of $1.00 per year. To non-subscribers the price is $2.50 a year.

EVERY READER OF THE REPORTER OUGHT TO TAKE THE COMPENDIUM.

The January number is better printed and handsomer than any before it. Send for specimen.

Address:

DRS. RANDOLPH & DULLES,

P. O. Box 843. Philadelphia.

The Medical and Surgical Reporter

I (WITH ONE EXCEPTION)

THE OLDEST MEDICAL JOURNAL IN AMERICA,

PUBLISHED WEEKLY.

IT HAS (WITH ONE EXCEPTION)

The Largest Circulation of any Weekly Medical Journal in America

It aims to meet the average wants of the medical man, being always interesting, instructive and clear, filled with *practical articles*, such as may be useful to the practitioner, rather than the laboratory student. It contains valuable original articles, full reports of clinics, hospital notes, society proceedings, reviews of new books and of medical pamphlets, literary notes, interesting correspondence,

Abstracts from the Best Medical Journals all over the World,

BRIGHT ITEMS OF NEWS,

and some HUMOR in every number.

The EDITORIALS are prepared with especial regard to the good of its readers and the interest of the profession.

THE REPORTER is a journal which is conducted with other objects than mere money making. It is *not published in the interest of any medical school or publishing house*, but

FOR ITS READERS;

and we hope that it may be—in the future even more than in the past—an honored means of communication between the best men in the medical profession. We point with some pride to the increase in its circulation, and confidently expect this progress to continue.

WILL YOU GET US SOME NEW SUBSCRIBERS?

Any *subscriber* whose subscription is already paid, or who remits the full amount of his own indebtedness to the REPORTER, who secures a new subscriber and *payment in advance*, may retain $2.00 of the amount of the new subscription and send us $3.00, upon receipt of which we will send the REPORTER to the new subscriber from January 1st, 1888, to January 1st, 1889.

Money can be sent by registered letter or by money order. Be careful to send money only to

Drs. RANDOLPH & DULLES,

P. O. Box, 843. PHILADELPHIA

Friedrichshall.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of considerably greater strength and efficacy than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—Prof. SEEGEN.

"After twenty years' use I appreciate it as highly as ever."—Prof. VIRCHOW.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

Medicinal and Surgical Plasters, Absorbent Cottons, Lint and Gauze, plain or with any desired dication; Ligatures, Silk and Rubber Protectives; Plaster Paris Bandages; Lamb's Wool, Paper Wood-Wool; and Surgical Dressings, Plasters and Antiseptics of every description.

—SPECIAL FORMULÆ TO ORDER.—

Avoid Cheap Imitations by Always Specifying "SEABURY'S" or "S. & J."

MALTINE.

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms, is the only Malt Preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides and the Iodides.

It deserves to stand in the front rank of constructives; and the constructives by their preventive, corrective, and curative power, are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may often be resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan and Dimmock, *only three* possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. R. H. CRITTENDEN, *Professor of Physiological Chemistry in Yale College.*

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe; and recent analysis made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—superior to all other Malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	**MALTINE** with Peptones.	**MALTINE** Ferrated.
MALTINE with Alteratives.	**MALTINE** with Pepsin & Pancreatine	**MALTO-YERBINE.**
MALTINE with Cod Liver Oil.	**MALTINE** with Phosphates, Iron Quinine and Strychnia.	**MALTO-VIBURNIN.**
MALTINE with Hypophosphites.		**MALTINE** with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "MALTINE" should be written, and not simply the words "Malt Extract" or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply the regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

The Maltine Manufacturing Co.,

Laboratory, Yonkers-on-Hudson. **182 Fulton Street, New York.**

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

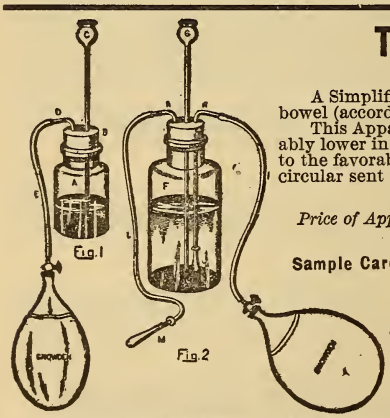
This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.



TREATMENT OF CONSUMPTION.

A Simplified Apparatus for the preparation and introduction of gases into the bowel (according to Dr. Bergeon's method) by Dr. H. N. Bryan, of Philadelphia.

This Apparatus has advantages which others do not possess, and being considerably lower in price than any devised for a similar purpose, it should commend itself to the favorable consideration of the medical profession. An illustrated descriptive circular sent to any address, on application.

Price of Apparatus, complete, in a neat portable Telescopic Case with Handle, **$6.00.**

Sample Card of the Iron-Dyed Silk (14 sizes) will be sent to any address on application. Price Per Reel, - 10 cts.

WILLIAM SNOWDEN,

Manufacturer, Importer and Exporter of Surgical Instruments,

ESTABLISHED 1846 MUNN & Co. PATENTS NEW YORK

After Forty years' experience in the preparation of more than One Hundred Thousand applications for patents in the United States and Foreign countries, the publishers of the Scientific American continue to act as solicitors for patents, caveats, trade-marks, copyrights, etc., for the United States, and to obtain patents in Canada, England, France, Germany, and all other countries. Their experience is unequaled and their facilities are unsurpassed.

Drawings and specifications prepared and filed in the Patent Office on short notice. Terms very reasonable. No charge for examination of models or drawings. Advice by mail free.

Patents obtained through Munn & Co. are noticed in the **SCIENTIFIC AMERICAN**, which has the largest circulation and is the most influential newspaper of its kind published in the world. The advantages of such a notice every patentee understands.

This large and splendidly illustrated newspaper is published **WEEKLY** at $3.00 a year, and is admitted to be the best paper devoted to science, mechanics, inventions, engineering works, and other departments of industrial progress, published in any country. It contains the names of all patentees and title of every invention patented each week. Try it four months for one dollar. Sold by all newsdealers.

If you have an invention to patent write to Munn & Co., publishers of Scientific American, 361 Broadway, New York.

Handbook about patents mailed free.

ACCIDENTS AND EMERGENCIES.

What to do First in Accidents and Emergencies.

BY CHARLES W. DULLES, M.D.,

SECOND EDITION, REVISED AND ENLARGED, WITH NEW ILLUSTRATIONS.

PRICE, - - - - 75 CENTS.

☞ "Contains directions for taking care of persons who have been injured by machinery, of the apparently drowned and suffocated, how to stop bleeding from wounds, how to treat sunstroke, burns, scalds, exhaustion, all sorts of fits and seizures, sprains, earache, toothache, etc., pains and emergencies that must be looked after at once, before the arrival of the doctor, and hints useful to doctors themselves. Also proper remedies to keep in the house, their effects and uses, etc."

"The instructions in regard to the treatment of injuries and sudden illnesses are thoroughly practical, andthe suggestions for supplies for emergencies are especially useful."—*New York Tribune.*

"It ought to be read once or twice each year."—*St. Louis Medical and Surgical Journal.*

"It is a Book which no family ought to be without."—*Boston Herald.*

A good book to recommend to the Heads of Families.

Sent by Mail on Receipt of 75 Cents.

QUARTERLY COMPENDIUM OF MEDICAL SCIENCE.

Subscribers to the MEDICAL AND SURGICAL REPORTER can obtain a very valuable supplement to it at a very low rate. THE QUARTERLY COMPENDIUM OF MEDICAL SCIENCE comprises four numbers a year, about 150 octavo pages each, of Careful Selections and Translations from the best American and Foreign Medical Journals.

The Selections are NOT DUPLICATES of what appears in the REPORTER, but DISTINCT AND INDEPENDENT ONES, most of them being longer than we care to put in the REPORTER.

The four numbers of The Compendium are sent to our subscribers for the nominal rate of $1.00 per year. To non-subscribers the price is $2.50 a year.

EVERY READER OF THE REPORTER OUGHT TO TAKE THE COMPENDIUM.

The January number is better printed and handsomer than any before it. Send for specimen.

Address:

DRS. RANDOLPH & DULLES,

P. O. Box 843. Philadelphia.

COMPRESSED TABLETS.

WE ask the attention of Physicians to the annexed list of recent additions of Compressed Tablets, as we think all of them are well deserving the careful attention of practitioners. We would be pleased to send to any physician, circular matter, compiled with great care and accuracy, giving therapeutic value and results in a concise form, that we are confident will be of interest, and possibly, of advantage to medical men who have not yet had access to the foreign and home authorities, from which we have culled the information we give.

Acid Boracic, - - - - 5 grs.
Acetanilide, - - - 3 and 5 "
Antifebrin, - - - 3 " 5 "
Antipyrine, - - - 3, 5 and 10 "
Blaud's
Ferri. Sulph. Exsic., 2 grs., Potass. Carb., 1 4-5 grs., Sacch. Alb., 1⅔ grs.
Iodol. - - - ½, 1, 2, 3, and 5 grs.
Manganese Binoxide, : - 1 " 2 "
Opium, Camphor and Carb. Ammon., Opium Denarcot. ½ gr., Camphor, 2 grs., Ammon Carb., 2½ grs.

Quinia Tannate, and Chocolate 1 grain, Quiniæ Tannat. 1 gr., Ext. Cacao, 9 grs.
Quinia Tannate and Chocolate, 2½ grs., Quiniæ Tannat. 2½ grs., Ext. Cacao, 7½ grs.
Salol, - - - - 2½ and 5 grs.
Sodium Succinate, . . 2 " 5 "
Thalline Sulphate, - - 2, 3 " 5 "
Trinitrin (Nitro-Glycerin), 1-20, 1-25, 1-33, 1-50,, 1-100, and 1-200 gr.
Terpin Hydrate, - - 2, 3 and 5 grs.

ANTISEPTIC TABLETS,

7.7 Hydrarg. Chlor. Corros., 7.3 Ammonium Chloride.

More than six months since, we sent a circular to the drug trade, stating that we had discontinued the manufacture of the Antiseptic Tablets, introduced by us several years since at the suggestion of Dr. Charles Meigs Wilson, of this city. We have, however, received so many letters from physicians urging us to resume the manufacture, insisting that the Tablets prepared by us dissolved more readily and were more satisfactory than any substitute they had been able to procure, that we feel we could not ignore such persistent demands from our medical friends, who have found our tablets an absolute necessity. We have therefore concluded to again prepare them, in a building entirely separate from our main estabishment, with appliances and admirably devised protection by means of improved respirators, that will completely overcome any harmful effects to those engaged in their manufacture.

Druggists and physicians will be glad to learn that the Tablets as now prepared are perfectly white and free from the coloring matter that we formerly added. This was done to lessen the danger of their being taken, or used in mistake; to guard against any such possibility, each Tablet, as now made, has the word "POISON" stamped upon it.

JOHN WYETH & BROTHER,
CHEMISTS, PHILADELPHIA.

The Medical and Surgical Reporter

(WITH ONE EXCEPTION)

THE OLDEST MEDICAL JOURNAL IN AMERICA,

PUBLISHED WEEKLY.

IT HAS (WITH ONE EXCEPTION)

The Largest Circulation of any Weekly Medical Journal in America

It aims to meet the average wants of the medical man, being always interesting, instructive and clear, filled with *practical articles*, such as may be useful to the practitioner, rather than the laboratory student. It contains valuable original articles, full reports of clinics, hospital notes, society proceedings, reviews of new books and of medical pamphlets, literary notes, interesting correspondence,

Abstracts from the Best Medical Journals all over the World,

BRIGHT ITEMS OF NEWS,

and some HUMOR in every number.

The EDITORIALS are prepared with especial regard to the good of its readers and the interest of the profession.

THE REPORTER is a journal which is conducted with other objects than mere money making. It is *not published in the interest of any medical school or publishing house*, but

FOR ITS READERS;

and we hope that it may be—in the future even more than in the past—an honored means of communication between the best men in the medical profession. We point with some pride to the increase in its circulation, and confidently expect this progress to continue.

WILL YOU GET US SOME NEW SUBSCRIBERS?

Any *subscriber* whose subscription is already paid, or who remits the full amount of his own indebtedness to the REPORTER, who secures a new subscriber and *payment in advance*, may retain $2.00 of the amount of the new subscription and send us $3.00, upon receipt of which we will send the REPORTER to the new subscriber from January 1st, 1888, to January 1st, 1889.

Money can be sent by registered letter or by money order. Be careful to send money only to

Drs. RANDOLPH & DULLES,

P. O. Box, 843. PHILADELPHIA.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. **INDISPENSABLE** AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS
DARK A NON-ALCOHOLIC LIQUID. WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

RIO CHEMICAL CO., ST. LOUIS: LONDON: PARIS.

FRANK K. HIPPLE.	GEORGE PHILLER,	HENRY C. GIBSON,
LEMUEL COFFIN,	EDWARD T. STEEL,	CHAS. W. HENRY,
BEAUVEAU BORIE,	JOHN F. BETZ,	WM. M. SINGERLY,
THOMAS DOLAN,	JOHN WANAMAKER,	R. DALE BENSON.

Solicitor,
GEORGE JUNKIN.

This Company is Agent for the sale of the reliable six per cent. Mortgages of "The New England Loan and Trust Company" of Des Moines, Iowa, and "The New England Trust Company" of Kansas City, Missouri; both Principal and Interest are guaranteed, and Interest is payable by Coupon in either New York or Philadelphia.

These Securities are entirely free from any Speculative Element. The Companies have invested in Western Mortgages for over 12 years, and during that period the amount of Foreclosures have been one-third of one per cent. of the total amount invested, and those Foreclosures have yielded a net Profit.

Particular information or Pamphlets concerning these Securities, will be furnished or sent by mail.

SPECIFY (BATTLE) WHEN PRESCRIBING OUR PREPARATIONS.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.

CLEARING OUT SALE

—OF—

POCKET RECORDS.

We have on hand a small number of Pocket-Records prepared for the year 1887.

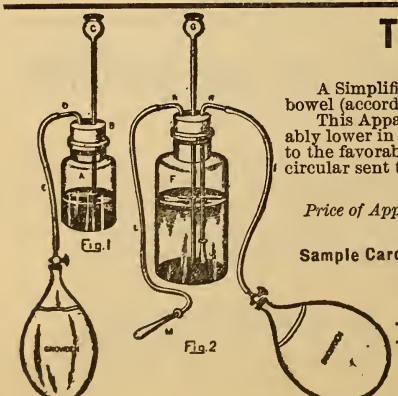
We would like to sell them, and in order to get rid of them, we will make the following offer; we will mail

A Pocket-Record for 30 Patients a week for 50 cents.
" " 60 " " 75 "

This is Less than the Books Cost Us.

There is nothing the matter with them, but we want to clear them out.

Drs. RANDOLPH & DULLES.



TREATMENT OF CONSUMPTION.

A Simplified Apparatus for the preparation and introduction of gases into the bowel (according to Dr. Bergeon's method) by Dr. H. N. Bryan, of Philadelphia.

This Apparatus has advantages which others do not possess, and being considerably lower in price than any devised for a similar purpose, it should commend itself to the favorable consideration of the medical profession. An illustrated descriptive circular sent to any address, on application.

Price of Apparatus, complete, in a neat portable Telescopic Case with Handle, **$6.00.**

Sample Card of the Iron-Dyed Silk (14 sizes) will be sent to any address on application. Price Per Reel, - 10 cts.

Clinical and practical instruction in the medical and surgical specialties is afforded, to physicians only, during the entire year. The College has well-fitted laboratories of pathology, microscopy, anatomy, surgery and electro-therapeutics.

In addition to the clinical facilities of the dispensary the professors utilize, for purposes of instruction, their services in the Philadelphia, Pennsylvania, Wills, Howard, Episcopal, Presbyterian, German, St. Mary's, and St. Christopher's Hospitals.

The Fee for each branch, for six consecutive weeks from date of issue, is $15.00. Any number of branches may be taken.

QUARTERLY COMPENDIUM OF MEDICAL SCIENCE.

Subscribers to the MEDICAL AND SURGICAL REPORTER can obtain a very valuable supplement to it at a very low rate. THE QUARTERLY COMPENDIUM OF MEDICAL SCIENCE comprises four numbers a year, about 150 octavo pages each, of Careful Selections and Translations from the best American and Foreign Medical Journals.

The Selections are NOT DUPLICATES of what appears in the REPORTER, but DISTINCT AND INDEPENDENT ONES, most of them being longer than we care to put in the REPORTER.

The four numbers of The Compendium are sent to our subscribers for the nominal rate of $1.00 per year. To non-subscribers the price is $2.50 a year.

EVERY READER OF THE REPORTER OUGHT TO TAKE THE COMPENDIUM.

The January number is better printed and handsomer than any before it. Send for specimen.

Address:

DRS. RANDOLPH & DULLES,

P. O. Box 843. **Philadelphia.**

The Medical and Surgical Reporter

(WITH ONE EXCEPTION)

THE OLDEST MEDICAL JOURNAL IN AMERICA,

PUBLISHED WEEKLY.

IT HAS (WITH ONE EXCEPTION)

The Largest Circulation of any Weekly Medical Journal in America

It aims to meet the average wants of the medical man, being always interesting, instructive and clear, filled with *practical articles*, such as may be useful to the practitioner, rather than the laboratory student. It contains valuable original articles, full reports of clinics, hospital notes, society proceedings, reviews of new books and of medical pamphlets, literary notes, interesting correspondence,

Abstracts from the Best Medical Journals all over the World,

BRIGHT ITEMS OF NEWS,

and some HUMOR in every number.

The EDITORIALS are prepared with especial regard to the good of its readers and the interest of the profession.

THE REPORTER is a journal which is conducted with other objects than mere money making. It is *not published in the interest of any medical school or publishing house*, but

FOR ITS READERS;

and we hope that it may be—in the future even more than in the past—an honored means of communication between the best men in the medical profession. We point with some pride to the increase in its circulation, and confidently expect this progress to continue.

WILL YOU GET US SOME NEW SUBSCRIBERS?

Any *subscriber* whose subscription is already paid, or who remits the full amount of his own indebtedness to the REPORTER, who secures a new subscriber and *payment in advance*, may retain $2.00 of the amount of the new subscription and send us $3.00, upon receipt of which we will send the REPORTER to the new subscriber from January 1st, 1888, to January 1st, 1889.

Money can be sent by registered letter or by money order. Be careful to send money only to

Drs. RANDOLPH & DULLES,

P. O. Box, 843. PHILADELPHIA.

THE UNION TRUST CO.,

611 and 613 CHESTNUT ST.

Philadelphia.

PAID-UP CAPITAL.....$500,000

Receives money on deposit and allows interest thereon.
Executes Trusts of every description known to the law.
Acts as Assignee, Receiver, Guardian, Executor and Administrator, and as Registrar for the stocks or bonds of corporations.
All Trust Funds kept separate from the other assets of the Company.
Rents small safes in its Burglar-Proof Vaults.
Receipts for wills and keeps them safely without charge.
Sells corporation and real-estate securities, also Western Farm Mortgage loans bearing 6 and 7 per cent. interest, payable at the office of the Company.
Principal and interest guaranteed by sound financial institutions.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhœa, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞ Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. INDISPENSABLE AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS

DARK — A NON-ALCOHOLIC LIQUID. — WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

RIO CHEMICAL CO., ST. LOUIS: LONDON: PARIS.

Samples FREE to any Physician who will pay Express charges, and mention this Journal.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

An Invaluable Aid in the Treatment of all Cases of Debility.

☞ ESTABLISHED 15 YEARS. ☞ ENDORSED BY SCORES OF PHYSICIANS. ☞ BEWARE OF IMITATIONS.

☞ ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, Soluble Citrate of Iron, Cinchona, Gentian, and simple aromatics. An official analysis of this preparation by the eminent chemist, ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement of by Sir ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

In the treatment of all cases of Debility, Convalescence from severe illness, Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Lack of Nerve Tone, and of the Alcohol and Opium Habits, and all maladies requiring a Tonic Nutrient, it is superior to all other preparations.

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion, and gives to weakened individuals that first prerequisite to improvement, an appetite.—By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label WITH IRON, "No. 1;" while the same preparation, WITHOUT IRON, is designated on the label as "No. 2."

☞ *I will, upon application, send a sample bottle of* COLDEN'S LIQUID BEEF TONIC *to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention* "COLDEN'S," *viz.*, "EXT. CARNIS FL. COMP. (COLDEN)." *It is put up in pint bottles, and* CAN BE HAD OF WHOLESALE AND RETAIL DRUGGISTS GENERALLY THROUGHOUT THE UNITED STATES.

C. N. CRITTENTON, Sole Agent, 115 Fulton Street, New York.

GLENN'S SULPHUR SOAP.

All physicians know the great value of the local use of Sulphur in the TREATMENT OF DISEASES OF THE SKIN. GLENN'S SULPHUR SOAP is the ORIGINAL and BEST combination of its kind, and the one now generally used. For sale by all Druggists at 25 cents a cake, or three cakes for 60 cents. Beware of counterfeits.

CONSTANTINE'S PINE TAR SOAP.

BY FAR THE BEST TAR SOAP MADE. Has been on trial among physicians for very many years as a toilet soap and healing agent, and its superior virtues have been unanimously conceded in ALL CASES WHERE THE USE OF TAR IS INDICATED.

Unsolicited expressions of its excellence have been received from the Medical Faculty generally. None genuine unless stamped "A. A. Constantine's Persian Healing Pine Tar Soap." For sale by all Druggists.

Wholesale Depot, C. N. CRITTENTON, 115 Fulton Street, New York.

Please mention this Journal. ☞ Samples of above Soaps SENT FREE on application to any physician enclosing card.

St. Louis College of Physicians and Surgeons.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of considerably greater strength and efficacy than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—**Prof. SEEGEN.**

"After twenty years' use I appreciate it as highly as ever."—

Prof. VIRCHOW.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

SEABURY & JOHNSON, New York and London.

BINDER FOR THE REPORTER.

This binder is the best we have used. A number have been prepared, of a size to fit the REPORTER, lettered in gilt, with its name. One will be sent by mail on receipt of fifty cents.

Each Binder Will Hold One Volume.

Address,

DRS. RANDOLPH & DULLES,

P. O. Box 843. PHILADELPHIA.

The Medical and Surgical Reporter,

ONE OF THE OLDEST MEDICAL JOURNALS IN AMERICA.

It aims to meet the average wants of the medical man, being always interesting, instructive and clear, filled with *practical articles*, such as may be useful to the practitioner, rather than the laboratory student. It contains valuable original articles, full reports of clinics, hospital notes, society proceedings, reviews of new books and of medical pamphlets, literary notes, interesting correspondence,

Abstracts from the Best Medical Journals all over the World,

Bright Items of News, and some HUMOR in every number. The EDITORIALS are prepared with especial regard to the good of its readers and the interest of the profession.

THE REPORTER is *not published in the interest of any medical school or publishing house*, but

FOR ITS READERS.

We hope that it may be—in the future even more than in the past—an honored means of communication between the best men in the medical profession.

Offers for New Subscribers.

To any new subscriber we will send the REPORTER from this date to the end of the year, for $3.00, paid in advance.

Address,

Drs. RANDOLPH & DULLES,

P. O. Box, 843. PHILADELPHIA.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞ Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

☞ Prepared from Manna, Purified Cathartic Acid, and Fruit Juices. ☜

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. **INDISPENSABLE** AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS

DARK — A NON-ALCOHOLIC LIQUID. — WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

McARTHUR'S SYRUP.

(SYR: HYPOPHOS: COMP: C. P. McARTHUR.)

Its use is indicated in Consumption and Tuberculosis, Diseases of the Chest, Chronic Cough, Throat Affections, General Debility, Brain Exhaustion, Impotence and Loss of Memory.

The point of primary importance in the use of the Hypophosphites is their *chemical* purity, but unfortunately they are too often adulterated.

So little seems to be generally known, even among the medical profession, with regard to the chemistry of the Hypophosphites, and the absolute necessity of CHEMICAL purity, that we call attention to this point.

One of the first effects produced by the use of our CHEMICALLY PURE Hypophosphites is a general increase of nervous energy, with a feeling of ease and comfort.

The second effect is an increase of appetite; digestion is improved, and the bowels become regular in their action, the quantity and color of the blood is increased, respiration is controlled, a better expansion of the chest is observed, cough improves, easy expectoration is produced, night perspiration diminishes, the face becomes fuller, the lips red, the nails and hair grow, and in children the teeth, showing the importance of the Hypophosphites on the organ of nutrition.

☞ Physicians when prescribing will please write thus:

℞ Syr: Hypophos: Comp: McArthhur. One Bottle.

As it is made *only for physicians* there are no printed wrappers or advertisements about the bottle.

Our pamphlet on the **CURABILITY AND TREATMENT OF CONSUMPTION,** sent free to physicians upon application.

We will send one bottle of McArthur's Syrup to any physician, without charge, who will pay the express charges on the same.

Mention this Journal. McARTHUR HYPOPHOSPHITE CO., BOSTON, Mass.

Mellin's Food.

PROF. DR. R. FRESENIUS, of Wiesbaden, Germany,

says:—"MELLIN'S FOOD contains 72.56 per cent. of carbohydrates; 9.75 per cent. of albuminoids; 4 37 per cent. of salts; and 13.32 per cent. of moisture. *Starch none; cane sugar none.*"

DR. A. STUTZER, of Bonn, Germany,

says:—"MELLIN'S FOOD, prepared with milk according to the directions accompanying it, perfectly fulfils every requisite of a food for infants. *Starch and cane sugar are entirely absent.*"

G. W. WIGNER, F.I.C., F.C.S., London, England,

President of the Society of Public Analysts,

says:—"MELLIN'S FOOD is not a mere starch or sugar food, like so many that are now sold, but it is a soluble preparation containing proper proportions of those nitrogenous and phosphatic matters which are essential for the health and growth of a child, but are not easily obtained in the prepared foods as usually sold."

These are the foremost chemists of the world, and it must be admitted that the correctness of their analyses is beyond question.

A sample of MELLIN'S FOOD, sufficient for trial, will be sent to any physician upon application.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.

THE UNION TRUST CO.,

Clinical and practical instruction in the medical and surgical specialties is afforded, to physicians only, during the entire year. The College has well-fitted laboratories of pathology, microscopy, anatomy, surgery and electro-therapeutics.

In addition to the clinical facilities of the dispensary the professors utilize, for purposes of instruction, their services in the Philadelphia, Pennsylvania, Wills, Howard, Episcopal, Presbyterian, German, St. Mary's, and St. Christopher's Hospitals.

The Fee for each branch, for six consecutive weeks from date of issue, is $15.00. Any number of branches may be taken.

The Pharmaceutical Monthly ERA.

A. B. LYONS, A M., M.D., EDITOR.
D. O. HAYNES & CO., PUBLISHERS.
DETROIT.

As an exponent of the progress of scientific and practical pharmacy the *Era* commends itself to the physician as the natural and necessary supplement to his medical journal or journals.

Physicians will be especially interested in the *Era Collective Investigations*, the object of which is to gather and publish evidence from competent observers throughout the land, on practical questions pertaining to pharmacology and scientific therapeutics.

The subscription of the *Era* is only $1.50 per year. For further information, or sample copy, address the publishers, D. O. HAYNES & CO., Box 583, Detroit, Mich.

ACCIDENTS AND EMERGENCIES.
3d Edition in Press.

FELLOWS'

HYPO-PHOS-PHITES

(SYR: HYPOPHOS: COMP: FELLOWS)

Contains **The essential elements** to the Animal Organization—Potash and Lime.

The **Oxydizing Agents**—Iron and Manganese;

The **Tonics**—Quinine and Strychnine;

And the **Vitalizing Constituent**—Phosphorus,

Combined in the form of a Syrup, with *slight alkaline reaction.*

It Differs in Effect from all others, being pleasant to taste, acceptable to the stomach, and harmless under prolonged use.

It has Sustained a High Reputation in America and England for efficiency in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs, and is employed also in various nervous and debilitating diseases with success.

Its Curative Properties are largely attributable to Stimulant, Tonic, and Nutritive qualities, whereby the various organic functions are recruited.

In Cases where innervating constitutional treatment is applied, and tonic treatment is desirable, this preparation will be found to act with safety and satisfaction.

Its Action is Prompt; stimulating the appetite and the digestion, it promotes assimilation, and enters directly into the circulation with the food products.

The Prescribed Dose produces a feeling of buoyancy, removing depression or melancholy, and hence is of great value in the treatment of MENTAL AND NERVOUS AFFECTIONS.

From its exerting a double tonic effect and influencing a healthy flow of the secretions, its use is indicated in a wide range of diseases.

Prepared by JAMES I. FELLOWS, Chemist,

48 VESEY STREET, NEW YORK.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

Prepared from the Aletris Farinosa, or True Unicorn.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation. It restores Normal Action to the Uterus, and imparts Vigor to the entire Uterine System.

☞ **Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.**

HAYGARTH M. ADDISON, L.R.C.P. & L.M., 145 Seven Sisters Road, London, N., says: I can only say that your ALETRIS CORDIAL is simply marvelous in its action. A splendid uterine tonic.

E. N. CAMPBELL, M. D., Good Hope, Ill., says: I used ALETRIS CORDIAL in a case of threatened abortion, and find it one of the finest and most efficient preparations that it has been my privilege to prescribe.

JAMES PATTERSON, M. D., Partick, Glasgow, says: I have used the ALETRIS CORDIAL in several cases of menorrhagia and of dysmenorrhea with much benefit.

J. HOME HAY, M.R.C.S. Eng., Alloa, Clackmannanshire, Scotland, says: I have used your ALETRIS CORDIAL in a case of threatened abortion, with very good results, and believe it to be a remarkably good preparation.

G. L. B. STONEY, L.K.Q.C.P. & L.R.C.S.I., Medical Officer, Lucan, Co. Dublin, Ireland, says: I have used your ALETRIS CORDIAL in amenorrhea with good effect. I intend to further test it.

A. W. HAWTHORNE, M. D., Rath House, Dromore, Co. Down, Ireland, says: The ALETRIS CORDIAL proved effectual in three cases of obstinate amenorrhea after the usual remedies had failed.

Dr. W. BERTHELOT, Santander, Spain, says: I have tried the ALETRIS CORDIAL, and it has seemed to me to be useful, especially in cases of dysmenorrhea.

E. A. WALL, L.K.W.C.P. & L.M., L.R.C.S.I., Carrick-on-Suir, Co. Tipperary, Ireland, says: I have used your ALETRIS CORDIAL in dysmenorrhea and leucorrhea, and its effects have been entirely satisfactory.

JOHN HORAN, L.R.C.P., etc., 26 Bridge Street, Sunderland, says: I beg to inform you that the case in which I prescribed your ALETRIS CORDIAL was one of amenorrhea which was greatly benefited by same.

Dr. GORDILLON, St. Amand, France, says: I have tried the ALETRIS CORDIAL in a case of dysmenorrhea. The result I obtained from the use of your preparation was excellent, better than I had obtained in the same patient by prescribing the usual remedies employed in such cases.

ED. B. BECKITT, L.R.C.P. Edin., L.R.C.S. Edin., Boston, Lincolnshire, England, says: I have prescribed your ALETRIS CORDIAL in a case of amenorrhea with the most gratifying results. I shall always use it in similar cases, as I believe it to be invaluable.

J. PENDER SMITH, M.B. & C.M., Sleet, by Bradford, England, says: The results obtained from the use of ALETRIS CORDIAL have been favorable. In two cases of suppressed menstruation in young girls, and in one case of excessive menstruation, the normal functions of the uterus were restored.

R. DOMENICHETTI, M. D., Trinity Lodge, Lincolnshire, England, testifies to the value of ALETRIS CORDIAL in uterine discharges.

RIO CHEMICAL CO.,

LONDON. ST. LOUIS, MO., U. S. A. PARIS.

MONTREAL, CANADA.

HYDROLEINE

(HYDRATED OIL)

FOR CONSUMPTION and WASTING DISEASES,

Produces Immediate Increase in Flesh and Weight.

FORMULA.

Each Dose of Two Teaspoonfuls equal to 120 Drops, contains:

Pure Cod Liver Oil...80 m. (drops)	Soda.....1.3 Grains.
Distilled Water.....35 "	Salicylic Acid.....1.4 "
Soluble Pancreatin.. 5 Grains.	Hyocholic Acid.....1.20 "

DOSE.—Two teaspoonfuls alone, or with twice the quantity of water to be taken thrice daily after meals.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhua, but a hydro-pancreated preparation containing acids and a modicum of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used completely saponifies the oleaginous material so necessary to the reparative process in all wasting diseases.

Each bottle in nutritive value exceeds ten times the same bulk of cod liver oil. It is economical in use and certain in results.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," by H. C. BARTLETT, Ph.D., F. C. S., *and the experiments which were made, together with cases illustrating the effect of Hydrated Oil in practice, are concisely stated in a Treatise on "Consumption and Wasting Diseases," by* G. OVEREND DREWRY, M.D. *Copies of these works sent free on application.*

SOLD AT ALL DRUG STORES, AT $1.00 PER BOTTLE.

C. N. CRITTENTON,

Sole Agent for the United States. 115 FULTON ST., NEW YORK.

A sample of Hydroleine will be sent free upon application, to any physician (inclosing business card) in the United States.

St. Louis College of Physicians and Surgeons.

The Ninth Academical year begins on September 1st and terminates on the last Saturday of May prox., comprising preliminary, regular and spring courses. The first and third optional. The regular session opens on the second Monday of October, continuing twenty weeks. The spring course offers all the opportunities of post-graduate instruction, inclusive of dissection, operations on cadaver, etc. Licensed practitioners by examination before Examining Boards or Boards of Health admitted to the graduating class. *Ad Eundem* degrees granted to graduates of two years standing by attending portion of regular course, and passing practical examination.

Fees for Academical Year, - - - $50.00.
Matriculation, - - - - - 5.00, paid but once.
Graduation Examination, - - - - 25.00, not returnable.

Abundant anatomical material at nominal prices for anatomical, pathological and operative pursuits. Abundant clinical material in all branches, inclusive. Practical obstetrics.

McARTHUR'S SYRUP.

(SYR: HYPOPHOS: COMP: C. P. McARTHUR.)

Its use is indicated in Consumption and Tuberculosis, Diseases of the Chest, Chronic Cough, Throat Affections, General Debility, Brain Exhaustion, Impotence and Loss of Memory.

The point of primary importance in the use of the Hypophosphites is their *chemical* purity, but unfortunately they are too often adulterated.

So little seems to be generally known, even among the medical profession, with regard to the chemistry of the Hypophosphites, and the absolute necessity of CHEMICAL purity, that we call attention to this point.

One of the first effects produced by the use of our CHEMICALLY PURE Hypophosphites is a general increase of nervous energy, with a feeling of ease and comfort.

The second effect is an increase of appetite; digestion is improved, and the bowels become regular in their action, the quantity and color of the blood is increased, respiration is controlled, a better expansion of the chest is observed, cough improves, easy expectoration is produced, night perspiration diminishes, the face becomes fuller, the lips red, the nails and hair grow, and in children the teeth, showing the importance of the Hypophosphites on the organ of nutrition.

☞ Physicians when prescribing will please write thus:

℞ Syr: Hypophos: Comp: McArthur. One Bottle.

As it is made *only for physicians* there are no printed wrappers or advertisements about the bottle.

Our pamphlet on the **CURABILITY AND TREATMENT OF CONSUMPTION,** sent free to physicians upon application.

We will send one bottle of McArthur's Syrup to any physician, without charge, who will pay the express charges on the same.

Mention this Journal. McARTHUR HYPOPHOSPHITE CO., BOSTON, Mass.

Mellin's Food.

PROF. DR. R. FRESENIUS, of Wiesbaden, Germany,

says:—"MELLIN'S FOOD contains 72.56 per cent. of carbohydrates; 9.75 per cent. of albuminoids; 4.37 per cent. of salts; and 13.32 per cent. of moisture. *Starch none; cane sugar none.*"

DR. A. STUTZER, of Bonn, Germany,

says:—"MELLIN'S FOOD, prepared with milk according to the directions accompanying it, perfectly fulfils every requisite of a food for infants. *Starch and cane sugar are entirely absent.*"

G. W. WIGNER, F.I.C., F.C.S., London, England,

President of the Society of Public Analysts,

says:—"MELLIN'S FOOD is not a mere starch or sugar food, like so many that are now sold, but it is a soluble preparation containing proper proportions of those nitrogenous and phosphatic matters which are essential for the health and growth of a child, but are not easily obtained in the prepared foods as usually sold."

These are the foremost chemists of the world, and it must be admitted that the correctness of their analyses is beyond question.

A sample of MELLIN'S FOOD, sufficient for trial, will be sent to any physician upon application.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

What to do First in Accidents and Emergencies.

BY CHARLES W. DULLES, M.D.

THIRD EDITION, THOROUGHLY REVISED AND FULLY ILLUSTRATED.

READY IN A FEW DAYS. PRICE, 75 CENTS.

☞ "Contains directions for taking care of persons who have been injured by machinery, of the apparently drowned and suffocated, how to stop bleeding from wounds, how to treat sunstroke, burns, scalds, exhaustion, all sorts of fits and seizures, sprains, earache, toothache, etc., pains and emergencies that must be looked after at once, before the arrival of the doctor, and hints useful to doctors themselves. Also proper remedies to keep in the house, their effects and uses, etc."

"The instructions in regard to the treatment of injuries and sudden illnesses are thoroughly practical, and the suggestions for supplies for emergencies are especially useful."—*New York Tribune.*

"It ought to be read once or twice each year."—*St. Louis Medical and Surgical Journal.*

"It is a Book which no family ought to be without."—*Boston Herald.*

A good book to recommend to the Heads of Families. **Sent by Mail on Receipt of 75 Cents.**

ADDRESS: Drs. RANDOLPH & DULLES, Philadelphia, Pa. P. O. Box 843.

THE EKEGREN WATCH!

The attention of the members of the Medical and Surgical profession is directed to the superior excellence of these celebrated Watches, conceded to be the finest in existence.

The independent chronographs of this maker, being especially recommended to those requiring thorough accuracy and precision in recording and time-marking for scientific or ordinary professional use.

J. E. CALDWELL & CO.,

Sole Agents for America,

902 Chestnut Street, - Philadelphia.

The Medical and Surgical Reporter,

ONE OF THE OLDEST MEDICAL JOURNALS IN AMERICA.

It aims to meet the average wants of the medical man, being always interesting, instructive and clear, filled with *practical articles*, such as may be useful to the practitioner, rather than the laboratory student. It contains valuable original articles, full reports of clinics, hospital notes, society proceedings, reviews of new books and of medical pamphlets, literary notes, interesting correspondence,

Abstracts from the Best Medical Journals all over the World,

Bright Items of News, and some HUMOR in every number. The EDITORIALS are prepared with especial regard to the good of its readers and the interest of the profession.

THE REPORTER is *not published in the interest of any medical school or publishing house*, but

FOR ITS READERS.

We hope that it may be—in the future even more than in the past—an honored means of communication between the best men in the medical profession.

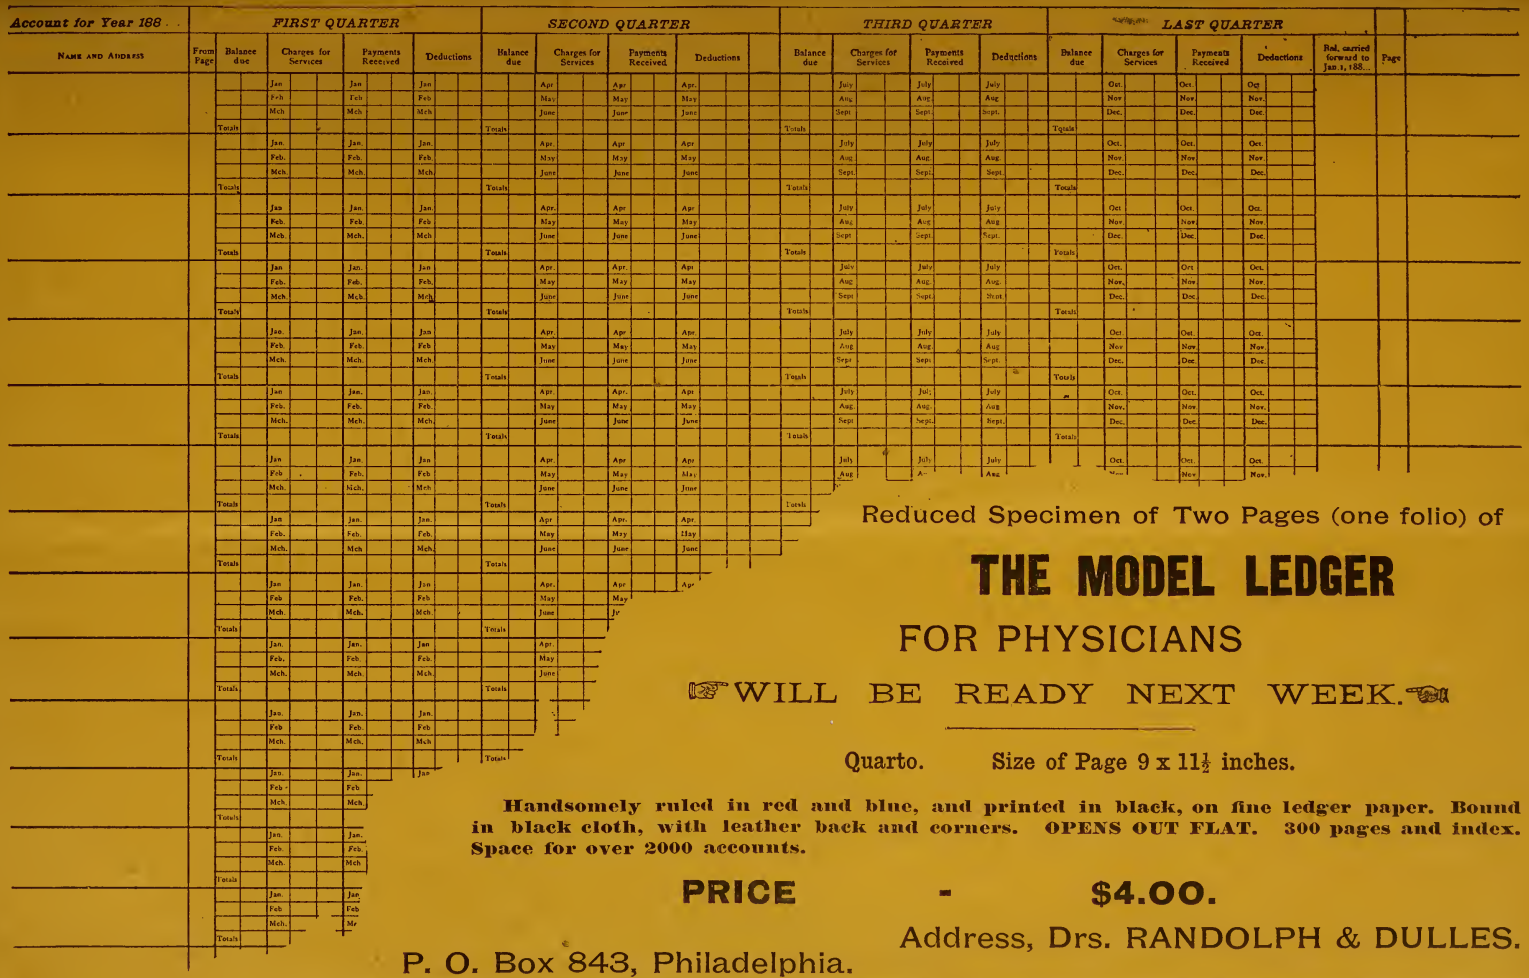
OFFER FOR NEW SUBSCRIBERS:

To any new subscriber we will send the REPORTER from this date to the end of the year, for $3.00, paid in advance.

Address,

Drs. RANDOLPH & DULLES,

P. O. Box, 843. PHILADELPHIA.



Reduced Specimen of Two Pages (one folio) of

THE MODEL LEDGER

FOR PHYSICIANS

☞ WILL BE READY NEXT WEEK. ☜

Quarto. Size of Page 9 x 11½ inches.

Handsomely ruled in red and blue, and printed in black, on fine ledger paper. Bound in black cloth, with leather back and corners. OPENS OUT FLAT. 300 pages and index. Space for over 2000 accounts.

PRICE - $4.00.

Address, Drs. RANDOLPH & DULLES.

P. O. Box 843, Philadelphia.

SUCCUS ALTERANS

(McDADE.)

SUCCUS ALTERANS is a purely vegetable compound of the preserved juices of Stillingia Sylvatica, Lappa Minor, Phytolacca Decandra, Smilax Sarsaparilla and Xanthoxylum Carolinianum, as collected by DR. GEO. W. MCDADE exclusively for ELI LILLY & Co., and endorsed by DR. J. MARION SIMS.

SUCCUS ALTERANS continues to gain favor from its remarkable Alterative and Tonic properties, *eliminating specific poison from the blood* and *increasing the proportion of red corpuscles in anæmic patients* to a wonderful degree; is endorsed by the medical profession and in use by many hospitals of note.

SUCCUS ALTERANS in venereal and cutaneous diseases is fast supplanting Mercury, the Iodides and Arsenic; and is a certain remedy for Mercurialization, Iodism and the dreadful effects often following the use of Arsenic in skin diseases.

SUCCUS ALTERANS is also strongly recommended for its Tonic and Alterative effects in myriad forms of scrofulous disease, and in all cases where anæmia is a factor. Such patients rapidly develop a good appetite, sleep soundly and gain flesh rapidly. Many cases are on record where patients increased ten to twenty-five pounds in weight in a few weeks.

SUCCUS ALTERANS is giving satisfactory results in treatment of *Chronic Rheumatism* and can be used with confidence.

SUCCUS ALTERANS may be given for any length of time, without injury to the patient.

SUCCUS ALTERANS is put up in pint round amber bottles and *never in bulk.*

PHYSICIANS who have not received DR. MCDADE'S latest publication, the MONOGRAPHIA SYPHILITICA, should send their address, mentioning this journal, and we will mail a copy. It contains a paper, illustrated with colored plates, by DR. D. H. GOODWILLIE, of New York, on the "Sequelæ of Syphilis," reports of cases in practice and many other valuable papers.

ELIXIR PURGANS.

ELIXIR PURGANS (LILLY) reliably stimulates the dormant liver without undue irritation, and has gentle yet positive effect upon the alimentary tract. In HABITUAL CONSTIPATION, so common in WOMEN AND CHILDREN, it will be found particularly useful. Its endorsement at Bellevue and many other prominent hospitals East and West, as well as its employment in general practice by the most eminent medical men, confirms the experience of years in its use.

Each Teaspoonful Represents	
Rhamnus Purshiana, -	10 grs.
Euonymus Atropur., - -	8 grs.
Cassia Acutifolia (Purif.) -	10 grs.
Iris Versicolor, - - -	4 grs.
Hyoscyamus Niger, - -	2 grs.
Aromatics, etc.	

IN PRESCRIBING, PLEASE BE CAREFUL TO WRITE

ELIXIR PURGANS (LILLY),

THAT OTHER PREPARATIONS MAY NOT BE SUBSTITUTED.

HIGHLY RECOMMENDED.

We take pleasure in endorsing the ELIXIR PURGANS (LILLY) as prepared from the above formula, for in it we find a near approach to positive *perfection* in the form of a *Liquid Cathartic*, and, from our experience with the preparation, can highly recommend it to the profession.

SUPPLIED BY ALL DRUGGISTS.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation, IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

☞ Prepared from Manna, Purified Cathartic Acid, and Fruit Juices. ☜

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. INDISPENSABLE AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS
DARK A NON-ALCOHOLIC LIQUID. WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

RIO CHEMICAL CO., ST. LOUIS: LONDON: PARIS.

Samples FREE to any Physician who will pay Express charges, and mention this Journal.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.

THE UNION TRUST CO.,

NEW AND RELIABLE RECIPES FOR PHYSICIANS PRESCRIBING.

In order to get the full therapeutic effects, physicians will please specify (WARNER & Co.) when ordering or prescribing.

☞The coating of the following pill will dissolve in 4½ minutes.☜

Pil: Chalybeate Comp.

(WARNER & CO.)

Nux Vomica is added as an ingredient to Pill Chalybeate to increase the tonic effect when desired.

Composition of each Pill.—℞ (Chalybeate Mass.), Carb. Protoxide of Iron, gr. 2½., Ext. Nuc. Vom. gr. 1-6.

DOSE—1 to 3 Pills.

Most advantageously employed in the treatment of Anæmia, Chlorosis, Phthisis, Scrofula, Loss of Appetite, etc.

Pil: Antiseptic Comp.

(WARNER & CO.)

Each Pill contains: Sulphite Soda, 1 gr. Salicylic Acid, 1 gr. Ext. Nuc. Vomica, ⅛ gr. Powd. Capsicum, 1-10 gr. Conc't Pepsin, 1 gr.

DOSE—1 to 3 Pills.

Pil. Antiseptic Comp. are prescribed with great advantage in cases of Dyspepsia, Indigestion, and malassimilation of food.

Pil: Antiseptic.

Each Pill contains: Sulphite Soda, 1 gr. Salicylic Acid, 1 gr. Ext. Nuc. Vomica, ¼ gr.

DOSE.—1 to 3 Pills.

Pil. Antiseptic is prescribed with great advantage in cases of Dyspepsia attended with acid stomach and enfeebled digestion following excessive indulgence in eating or drinking. It is used with advantage in Rheumatism.

Prepared by WM. R. WARNER & CO.

Supplied upon physician's prescription by all leading druggists.

In corresponding with Advertisers, please mention THE MEDICAL AND SURGICAL REPORTER.

Friedrichshall.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of **considerably greater strength** and **efficacy** than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—**Prof. SEEGEN.**

"After twenty years' use I appreciate it as highly as ever."—
Prof. VIRCHOW.

OF ALL DRUGGISTS AND MINERAL WATER DEALERS.

YOU WILL FIND **BROMO-CAFFEINE** OF GREATEST SERVICE
IN
OF ALL TYPES **NERVOUS HEADACHES** OF ALL TYPES

Headaches from Loss of Sleep, Physical Fatigue, Excessive Study, Mental Anxiety, Neurasthenia, Dysmenorrhœa, Pregnancy, or other Ovarian Irritation. Relieves Insomnia, and is very useful in Asthma, Whooping Cough and Nervous Cough. Prevents Tinnitis Aurium during the administration of Quinine. Cures Sea Sickness, Quiets the Restlessness of Alcoholism, Morphia Craving, &c. Relieves Anxiety and Promotes Sleep.

☞**Avoid and discourage imitations and substitutions.**☜

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat, and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

"It is a Book which no family ought to be without."—*Boston Herald.*

A good book to recommend to the Heads of Families. **Sent by Mail on Receipt of 75 Cents.**

ADDRESS: Drs. RANDOLPH & DULLES, Philadelphia, Pa. P. O. Box 843

MALTINE.

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms, is the only Malt Preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides and the Iodides.

It deserves to stand in the front rank of constructives; and the constructives by their preventive, corrective, and curative power, are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may often be resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan and Dimmock, *only three* possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract and Keppler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. R. H. CRITTENDEN, *Professor of Physiological Chemistry in Yale College.*

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe; and recent analysis made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—superior to all other Malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	**MALTINE** with Peptones.	**MALTINE** Ferrated.
MALTINE with Alteratives.	**MALTINE** with Pepsin & Pancreatine	**MALTO-YERBINE.**
MALTINE with Cod Liver Oil.	**MALTINE** with Phosphates, Iron Quinine and Strychnia.	**MALTO-VIBURNIN.**
MALTINE with Hypophosphites.		**MALTINE** with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "MALTINE" should be written, and not simply the words "Malt Extract" or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply the regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

THE EKEGREN WATCH!

The attention of the members of the Medical and Surgical profession is directed to the superior excellence of these celebrated Watches, conceded to be the finest in existence.

The independent chronographs of this maker, being especially recommended to those requiring thorough accuracy and precision in recording and time-marking for scientific or ordinary professional use.

J. E. CALDWELL & CO.,

Sole Agents for America,

902 Chestnut Street, - Philadelphia.

The Medical and Surgical Reporter,

ONE OF THE OLDEST MEDICAL JOURNALS IN AMERICA.

It aims to meet the average wants of the medical man, being always interesting, instructive and clear, filled with *practical articles*, such as may be useful to the practitioner, rather than the laboratory student. It contains valuable original articles, full reports of clinics, hospital notes, society proceedings, reviews of new books and of medical pamphlets, literary notes, interesting correspondence,

Abstracts from the Best Medical Journals all over the World,

Bright Items of News, and some HUMOR in every number. The EDITORIALS are prepared with especial regard to the good of its readers and the interest of the profession.

THE REPORTER is *not published in the interest of any medical school or publishing house*, but

FOR ITS READERS.

We hope that it may be—in the future even more than in the past—an honored means of communication between the best men in the medical profession.

OFFER FOR NEW SUBSCRIBERS:

To any new subscriber we will send the REPORTER from this date to the end of the year, for $3.00, paid in advance.

COMPRESSED TABLETS.

WE ask the attention of Physicians to the annexed list of recent additions of Compressed Tablets, as we think all of them are well deserving the careful attention of practitioners. We would be pleased to send to any physician, circular matter, compiled with great care and accuracy, giving therapeutic value and results in a concise form, which we are confident will be of interest, and possibly, of advantage to medical men who have not yet had access to the foreign and home authorities, from which we have culled the information we give.

Acid Boracic, - - - - 5 grs.

Acetanilide, - - - 3 and 5 "

Antifebrin, - - - 3 " 5 "

Antipyrine, - - - 3, 5 and 10 "

Blaud's
Ferri. Sulph. Exsic., 2 grs., Potass. Carb., 1 4-5 grs., Sacch. Alb., 1⅔ grs.

Iodol. - - - ½, 1, 2, 3, and 5 grs.

Quiniæ Tannate, and Chocolate 1 grain, (Quiniæ Tannat. 1 gr., Ext. Cacao, 9 grs.)

Quiniæ Tannate and Chocolate, 2½ grs., (Quiniæ Tannat. 2½ grs., Ext. Cacao, 7½ grs.)

Salol, - - - - 2½ and 5 grs.

Sodium Succinate, . . 2 " 5 "

Thalline Sulphate, - - 2, 3 " 5 "

Trinitrin (Nitro-Glycerin), 1-20, 1-25, 1-33, 1-50,, 1-100, and 1-200 gr.

Terpin Hydrate, - - 2, 3 and 5 grs.

ANTISEPTIC TABLETS,

7.7 Hydrarg. Chlor. Corros., 7.3 Ammonium Chloride.

More than six months since, we sent a circular to the drug trade, stating that we had discontinued the manufacture of the Antiseptic Tablets, introduced by us several years since at the suggestion of Dr. Charles Meigs Wilson, of this city. We have, however, received so many letters from physicians urging us to resume the manufacture, insisting that the Tablets prepared by us dissolved more readily and were more satisfactory than any substitute they had been able to procure, that we feel we could not ignore such persistent demands from our medical friends, who have found our tablets an absolute necessity. We have therefore concluded to again prepare them, in a building entirely separate from our main estabishment, with appliances and admirably devised protection by means of improved respirators, that will completely overcome any harmful effects to those engaged in their manufacture.

Druggists and physicians will be glad to learn that the Tablets as now prepared are perfectly white and free from the coloring matter that we formerly added. This was done to lessen the danger of their being taken, or used in mistake; to guard against any such possibility, each Tablet, as now made, has the word "POISON" stamped upon it.

TREATMENT OF CONSUMPTION.

A Simplified Apparatus for the preparation and introduction of gases into the bowel (according to Dr. Bergeon's method) by Dr. H. N. Bryan, of Philadelphia.

This Apparatus has advantages which others do not possess, and being considerably lower in price than any devised for a similar purpose, it should commend itself to the favorable consideration of the medical profession. An illustrated descriptive circular sent to any address, on application.

Price of Apparatus, complete, in a neat portable Telescopic Case with Handle, **$6.00.**

Sample Card of the Iron-Dyed Silk (14 sizes) will be sent to any address on application. Price Per Reel, - 10 cts.

WILLIAM SNOWDEN,

Manufacturer, Importer and Exporter of Surgical Instruments,

No. 7 South Eleventh St., Philadelphia.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. **INDISPENSABLE** AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS
DARK A NON-ALCOHOLIC LIQUID. WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.

ACCIDENTS AND EMERGENCIES.

BY CHARLES W. DULLES, M.D.,

Adopted as a Manual by the Boston Schools.

Contains plain and concise directions for the treatment of a large variety of accidents and domestic emergencies, with a list of supplies likely to be useful and easy to keep on hand. It ought to be on every mother's bureau and in every factory in the land.

Physicians will find its pages helpful for themselves and for families under their care.

Sent by Mail on Receipt of 75 Cents.

"It is a Book which no family ought to be without."—*Boston Herald.*

ADDRESS: Drs. RANDOLPH & DULLES,

P. O. Box 843. PHILADELPHIA, PA.

HYDROLEINE

(HYDRATED OIL)

FOR CONSUMPTION and WASTING DISEASES,
Produces Immediate Increase in Flesh and Weight.

FORMULA.

Each Dose of Two Teaspoonfuls equal to 120 Drops, contains:

Pure Cod Liver Oil...80 m. (drops)	Soda.....1.3 Grains.
Distilled Water.....35 "	Salicylic Acid.....1.4 "
Soluble Pancreatin.. 5 Grains.	Hyocholic Acid.....1.20 "

DOSE.—Two teaspoonfuls alone, or with twice the quantity of water to be taken thrice daily after meals.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation containing acids and a modicum of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used completely saponifies the oleaginous material so necessary to the reparative process in all wasting diseases.

Each bottle in nutritive value exceeds ten times the same bulk of cod liver oil. It is economical in use and certain in results.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," by H. C. BARTLETT, Ph.D., F. C. S., *and the experiments which were made, together with cases illustrating the effect of Hydrated Oil in practice, are concisely stated in a Treatise on "Consumption and Wasting Diseases," by* G. OVEREND DREWRY, M.D. *Copies of these works sent free on application.*

SOLD AT ALL DRUG STORES, AT $1.00 PER BOTTLE.

C. N. CRITTENTON,

Sole Agent for the United States. **115 FULTON ST., NEW YORK.**

A sample of Hydroleine will be sent free upon application, to any physician (inclosing business card) in the United States.

St. Louis College of Physicians and Surgeons.

The Ninth Academical year begins on September 1st and terminates on the last Saturday of May prox., comprising preliminary, regular and spring courses. The first and third optional. The regular session opens on the second Monday of October, continuing twenty weeks. The spring course offers all the opportunities of post-graduate instruction, inclusive of dissection, operations on cadaver, etc. Licensed practitioners by examination before Examining Boards or Boards of Health admitted to the graduating class. *Ad Eundem* degrees granted to graduates of two years standing by attending portion of regular course, and passing practical examination.

Fees for Academical Year, - - - - $50.00.
Matriculation, - - - - - 5.00, paid but once.
Graduation Examination, - - - - - 25.00, not returnable.

Abundant anatomical material at nominal prices for anatomical, pathological and operative pursuits. Abundant clinical material in all branches, inclusive. Practical obstetrics.

McARTHUR'S SYRUP.

(SYR: HYPOPHOS: COMP: C. P. McARTHUR.)

Its use is indicated in Consumption and Tuberculosis, Diseases of the Chest, Chronic Cough, Throat Affections, General Debility, Brain Exhaustion, Impotence and Loss of Memory.

The point of primary importance in the use of the Hypophosphites is their *chemical* purity, but unfortunately they are too often adulterated.

So little seems to be generally known, even among the medical profession, with regard to the chemistry of the Hypophosphites, and the absolute necessity of CHEMICAL purity, that we call attention to this point.

One of the first effects produced by the use of our CHEMICALLY PURE Hypophosphites is a general increase of nervous energy, with a feeling of ease and comfort.

The second effect is an increase of appetite; digestion is improved, and the bowels become regular in their action, the quantity and color of the blood is increased, respiration is controlled, a better expansion of the chest is observed, cough improves, easy expectoration is produced, night perspiration diminishes, the face becomes fuller, the lips red, the nails and hair grow, and in children the teeth, showing the importance of the Hypophosphites on the organ of nutrition.

☞ Physicians when prescribing will please write thus:

℞ Syr: Hypophos: Comp: McArthhur. One Bottle.

As it is made *only for physicians* there are no printed wrappers or advertisements about the bottle.

Our pamphlet on the **CURABILITY AND TREATMENT OF CONSUMPTION,** sent free to physicians upon application.

We will send one bottle of McArthur's Syrup to any physician, without charge, who will pay the express charges on the same.

Mention this Journal. McARTHUR HYPOPHOSPHITE CO., BOSTON, Mass.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

J. E. CALDWELL & CO.,

Sole Agents for America,

902 Chestnut Street, - Philadelphia.

The Medical and Surgical Reporter,

ONE OF THE OLDEST MEDICAL JOURNALS IN AMERICA.

It aims to meet the average wants of the medical man, being always interesting, instructive and clear, filled with *practical articles*, such as may be useful to the practitioner, rather than the laboratory student. It contains valuable original articles, full reports of clinics, hospital notes, society proceedings, reviews of new books and of medical pamphlets, literary notes, interesting correspondence,

Abstracts from the Best Medical Journals all over the World,

Bright Items of News, and some HUMOR in every number. The EDITORIALS are prepared with especial regard to the good of its readers and the interest of the profession.

THE REPORTER is *not published in the interest of any medical school or publishing house*, but

FOR ITS READERS.

We hope that it may be—in the future even more than in the past—an honored means of communication between the best men in the medical profession.

OFFER FOR NEW SUBSCRIBERS:

To any new subscriber we will send the REPORTER from this date to the end of the year, for $3.00, paid in advance.

Address,

Drs. RANDOLPH & DULLES,

P. O. Box, 843. PHILADELPHIA.

THE REAL ESTATE TRUST COMPANY

OF PHILADELPHIA,

No. 1340 Chestnut Street.

CAPITAL - - - - $500,000.

This Company receives DEPOSITS OF MONEY payable by Check on demand, and allows Interest thereon at the rate of Two per cent. per annum; also receives Deposits for a definite time, subject to notice (for which negotiable Certificates of Deposit are given), and on which special rates of Interest will be allowed.

This Company receives for SAFE KEEPING in its Burglar and Fire-Proof Vaults,

Securities, Gold, Silver, Plate, Jewelry, Deeds, Mortgages,

or any Portable Article of large or small value; also, rents Safe Deposit Boxes within its Vaults, at from $5.00 upward per annum, according to size and location. The location being central, makes it especially convenient for Ladies and Physicians, as evidenced by the numbers already availing themselves of this branch of the Company's service.

This Company transacts a general REAL ESTATE BUSINESS, acting as Agent or Attorney for Buying, Leasing and Selling Real Estate in Philadelphia and its vicinity; negotiates Mortgages and places Ground Rents; collects Rents and takes general charge and management of Property; Insures Titles to Real Estate and Mortgages.

This Company receives TRUSTS of every description, acting as Executor, Administrator, Trustee, Guardian, Receiver, Attorney, etc., and executing Surety for the faithful performance of any Trust or Office; Receives and Receipts for Wills for Safe Keeping without charge.

All TRUST FUNDS AND INVESTMENTS are kept separate and apart from those of the Company.

President,
FRANK K. HIPPLE.

Secretary,
WILLIAM R. PHILLER,

Treasurer,
WILLIAM F. NORTH.

Real Estate Officer,
THOMAS B. PROSSER.

Directors:

Frank K. Hipple.	George Philler,	Henry C. Gibson,
Lemuel Coffin,	Edward T. Steel,	Chas. W. Henry,
Beauveau Borie,	John F. Betz,	Wm. M. Singerly,
Thomas Dolan,	John Wanamaker,	R. Dale Benson.

Solicitor,
GEORGE JUNKIN.

This Company is Agent for the sale of the reliable six per cent. Mortgages of "The New England Loan and Trust Company" of Des Moines, Iowa, and "The New England Trust Company" of Kansas City, Missouri; both Principal and Interest are guaranteed, and Interest is payable by Coupon in either New York or Philadelphia.

These Securities are entirely free from any Speculative Element. The Companies have invested in Western Mortgages for over 12 years, and during that period the amount of Foreclosures have been one-third of one per cent. of the total amount invested, and those Foreclosures have yielded a net Profit.

Particular information or Pamphlets concerning these Securities, will be furnished or sent by mail.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.

THE UNION TRUST CO.,

611 and 613 CHESTNUT ST.

Philadelphia.

PAID-UP CAPITAL.....$500,000

Receives money on deposit and allows interest thereon.
Executes Trusts of every description known to the law.
Acts as Assignee, Receiver, Guardian, Executor and Administrator, and as Registrar for the stocks or bonds of corporations.
All Trust Funds kept separate from the other assets of the Company.
Rents small safes in its Burglar-Proof Vaults.
Receipts for wills and keeps them safely without charge.
Sells corporation and real-estate securities, also Western Farm Mortgage loans bearing 6 and 7 per cent. interest, payable at the office of the Company.
Principal and interest guaranteed by sound financial institutions.

Mellin's Food.

PROF. DR. R. FRESENIUS, of Wiesbaden, Germany,

says:—"MELLIN'S FOOD contains 72.56 per cent. of carbohydrates; 9.75 per cent. of albuminoids; 4.37 per cent. of salts; and 13.32 per cent. of moisture. *Starch none; cane sugar none.*"

DR. A. STUTZER, of Bonn, Germany,

says:—"MELLIN'S FOOD, prepared with milk according to the directions accompanying it, perfectly fulfils every requisite of a food for infants. *Starch and cane sugar are entirely absent.*"

G. W. WIGNER, F.I.C., F.C.S., London, England,

President of the Society of Public Analysts,

says:—"MELLIN'S FOOD is not a mere starch or sugar food, like so many that are now sold, but it is a soluble preparation containing proper proportions of those nitrogenous and phosphatic matters which are essential for the health and growth of a child, but are not easily obtained in the prepared foods as usually sold."

These are the foremost chemists of the world, and it must be admitted that the correctness of their analyses is beyond question.

A sample of MELLIN'S FOOD, sufficient for trial, will be sent to any physician upon application.

Doliber, Goodale & Co., Boston, Mass.

SOMETHING NEW.

ELIXIR OF COCA AND CALISAYA

which represents the virtues of these drugs in a *most active and palatable form.* The process of manufacture is ENTIRELY ORIGINAL—that of direct fermentation from the bark and leaf—and we claim that better results can be obtained from this preparation than from any other combination of *Coca and Calisaya* now made.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of **considerably greater strength** and **efficacy** than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—**Prof. SEEGEN.**

"After twenty years' use I appreciate it as highly as ever."—
Prof. VIRCHOW.

OF ALL DRUGGISTS AND MINERAL WATER DEALERS.

YOU WILL FIND **BROMO-CAFFEINE** OF GREATEST SERVICE
IN
OF ALL TYPES **NERVOUS HEADACHES** OF ALL TYPES

Headaches from Loss of Sleep, Physical Fatigue, Excessive Study, Mental Anxiety, Neurasthenia, Dysmenorrhœa, Pregnancy, or other Ovarian Irritation. Relieves Insomnia, and is very useful in Asthma, Whooping Cough and Nervous Cough. Prevents Tinnitis Aurium during the administration of Quinine. Cures Sea Sickness, Quiets the Restlessness of Alcoholism, Morphia Craving, &c. Relieves Anxiety and Promotes Sleep.

SPECIFY (BATTLE) WHEN PRESCRIBING OUR PREPARATIONS.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

P. O. Box 843. PHILADELPHIA.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

☞ Prepared from Manna, Purified Cathartic Acid, and Fruit Juices. ☜

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. INDISPENSABLE AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS

DARK A NON-ALCOHOLIC LIQUID. WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

Clinical and practical instruction in the medical and surgical specialties is afforded, to physicians only, during the entire year. The College has well-fitted laboratories of pathology, microscopy, anatomy, surgery and electro-therapeutics.

In addition to the clinical facilities of the dispensary the professors utilize, for purposes of instruction, their services in the Philadelphia, Pennsylvania, Wills, Howard, Episcopal, Presbyterian, German, St. Mary's, and St. Christopher's Hospitals.

The Fee for each branch, for six consecutive weeks from date of issue, is $15.00. Any number of branches may be taken.

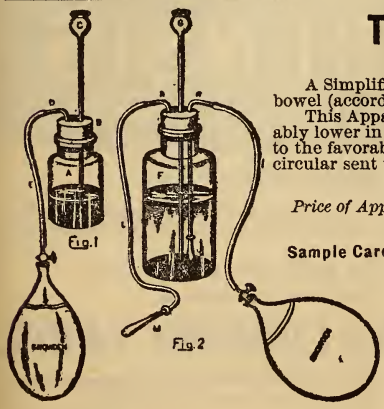
P.O. BOX 843, PHILADELPHIA.



TREATMENT OF CONSUMPTION.

A Simplified Apparatus for the preparation and introduction of gases into the bowel (according to Dr. Bergeon's method) by Dr. H. N. Bryan, of Philadelphia.

This Apparatus has advantages which others do not possess, and being considerably lower in price than any devised for a similar purpose, it should commend itself to the favorable consideration of the medical profession. An illustrated descriptive circular sent to any address, on application.

Price of Apparatus, complete, in a neat portable Telescopic Case with Handle, **$6.00.**

Sample Card of the Iron-Dyed Silk (14 sizes) will be sent to any address on application. Price Per Reel, - 10 cts.

WILLIAM SNOWDEN,

Manufacturer, Importer and Exporter of Surgical Instruments,

No. 7 South Eleventh St., Philadelphia.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH — Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation, IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

☞ Prepared from Manna, Purified Cathartic Acid, and Fruit Juices. ☜

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. **INDISPENSABLE** AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS
DARK A NON-ALCOHOLIC LIQUID. WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorater."

An Invaluable Aid in the Treatment of all Cases of Debility.

☞ ESTABLISHED 15 YEARS. ☞ ENDORSED BY SCORES OF PHYSICIANS. ☞ BEWARE OF IMITATIONS.

☞ ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, Soluble Citrate of Iron, Cinchona, Gentian, and simple aromatics. An official analysis of this preparation by the eminent chemist, ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement of by Sir ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

In the treatment of all cases of Debility, Convalescence from severe illness, Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Lack of Nerve Tone, and of the Alcohol and Opium Habits, and all maladies requiring a Tonic Nutrient, it is superior to all other preparations.

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion, and gives to weakened individuals that first prerequisite to improvement, an appetite.—By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label WITH IRON, "No. 1;" while the same preparation, WITHOUT IRON, is designated on the label as "No. 2."

☞ *I will, upon application, send a sample bottle of* COLDEN'S LIQUID BEEF TONIC *to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention* "COLDEN'S," *viz.,* "EXT. CARNIS FL. COMP. (COLDEN)." *It is put up in pint bottles, and* CAN BE HAD OF WHOLESALE AND RETAIL DRUGGISTS GENERALLY THROUGHOUT THE UNITED STATES.

C. N. CRITTENTON, Sole Agent, 115 Fulton Street, New York.

GLENN'S SULPHUR SOAP.

All physicians know the great value of the local use of Sulphur in the TREATMENT OF DISEASES OF THE SKIN. GLENN'S SULPHUR SOAP is the ORIGINAL and BEST combination of its kind, and the one now generally used. For sale by all Druggists at 25 cents a cake, or three cakes for 60 cents. Beware of counterfeits.

CONSTANTINE'S PINE TAR SOAP.

BY FAR THE BEST TAR SOAP MADE. Has been on trial among physicians for very many years as a toilet soap and healing agent, and its superior virtues have been unanimously conceded in ALL CASES WHERE THE USE OF TAR IS INDICATED.

Unsolicited expressions of its excellence have been received from the Medical Faculty generally. None genuine unless stamped "A. A. Constantine's Persian Healing Pine Tar Soap." For sale by all Druggists.

Wholesale Depot, C. N. CRITTENTON, 115 Fulton Street, New York.

Please mention this Journal. ☞ Samples of above Soaps SENT FREE on application to any physician enclosing card.

WHEELER & EVANS, SOLE AGENTS,
No. 416 Walnut St., Philadelphia.

McARTHUR'S SYRUP.

(SYR: HYPOPHOS: COMP: C. P. McARTHUR.)

Its use is indicated in Consumption and Tuberculosis, Diseases of the Chest, Chronic Cough, Throat Affections, General Debility, Brain Exhaustion, Impotence and Loss of Memory.

The point of primary importance in the use of the Hypophosphites is their *chemical* purity, but unfortunately they are too often adulterated.

So little seems to be generally known, even among the medical profession, with regard to the chemistry of the Hypophosphites, and the absolute necessity of CHEMICAL purity, that we call attention to this point.

One of the first effects produced by the use of our CHEMICALLY PURE Hypophosphites is a general increase of nervous energy, with a feeling of ease and comfort.

The second effect is an increase of appetite; digestion is improved, and the bowels become regular in their action, the quantity and color of the blood is increased, respiration is controlled, a better expansion of the chest is observed, cough improves, easy expectoration is produced, night perspiration diminishes, the face becomes fuller, the lips red, the nails and hair grow, and in children the teeth, showing the importance of the Hypophosphites on the organ of nutrition.

☞ Physicians when prescribing will please write thus:

℞ SYR: HYPOPHOS: COMP: McARTHUR. ONE BOTTLE.

As it is made *only for physicians* there are no printed wrappers or advertisements about the bottle.

Our pamphlet on the **CURABILITY AND TREATMENT OF CONSUMPTION,** sent free to physicians upon application.

We will send one bottle of McArthur's Syrup to any physician, without charge, who will pay the express charges on the same.

Mention this Journal. McARTHUR HYPOPHOSPHITE CO., BOSTON, Mass.

FELS'S GERMICIDE SOAP.

A preparation of the Naphthols, Eucalyptus, Methyl Salicylate, etc., together with 1-1000 Corrosive Sublimate through the medium of Pure Neutral Soap.

FELLOWS'

HYPO-PHOS-PHITES

(SYR: HYPOPHOS: COMP: FELLOWS)

Contains **The essential elements** to the Animal Organization—Potash and Lime.

The **Oxydizing Agents**—Iron and Manganese;

The **Tonics**—Quinine and Strychnine;

And the **Vitalizing Constituent**—Phosphorus,

Combined in the form of a Syrup, with *slight alkaline reaction.*

It Differs in Effect from all others, being pleasant to taste, acceptable to the stomach, and harmless under prolonged use.

It has Sustained a High Reputation in America and England for efficiency in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs, and is employed also in various nervous and debilitating diseases with success.

Its Curative Properties are largely attributable to Stimulant, Tonic, and Nutritive qualities, whereby the various organic functions are recruited.

In Cases where innervating constitutional treatment is applied, and tonic treatment is desirable, this preparation will be found to act with safety and satisfaction.

Its Action is Prompt; stimulating the appetite and the digestion, it promotes assimilation, and enters directly into the circulation with the food products.

The Prescribed Dose produces a feeling of buoyancy, removing depression or melancholy, and hence is of great value in the treatment of MENTAL AND NERVOUS AFFECTIONS.

From its exerting a double tonic effect and influencing a healthy flow of the secretions, its use is indicated in a wide range of diseases.

Prepared by JAMES I. FELLOWS, Chemist,

48 VESEY STREET, NEW YORK.

Circulars Sent to Physicians on Application.

FOR SALE BY ALL DRUGGISTS.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

SUCCUS ALTERANS

(McDADE.)

SUCCUS ALTERANS is a purely vegetable compound of the preserved juices of Stillingia Sylvatica Lappa Minor, Phytolacca Decandra, Smilax Sarsaparilla and Xanthoxylum Carolinianum, as collected by DR. GEO. W. MCDADE exclusively for ELI LILLY & Co., and endorsed by DR. J. MARION SIMS.

SUCCUS ALTERANS continues to gain favor from its remarkable Alterative and Tonic properties, *eliminating specific poison from the blood* and *increasing the proportion of red corpuscles in anæmic patients* to a wonderful degree; is endorsed by the medical profession and in use by many hospitals of note.

SUCCUS ALTERANS in venereal and cutaneous diseases is fast supplanting Mercury, the Iodides and Arsenic; and is a certain remedy for Mercurialization, Iodism and the dreadful effects often following the use of Arsenic in skin diseases.

SUCCUS ALTERANS is also strongly recommended for its Tonic and Alterative effects in myriad forms of scrofulous disease, and in all cases where anæmia is a factor. Such patients rapidly develop a good appetite, sleep soundly and gain flesh rapidly. Many cases are on record where patients increased ten to twenty-five pounds in weight in a few weeks.

SUCCUS ALTERANS is giving satisfactory results in treatment of *Chronic Rheumatism* and can be used with confidence.

SUCCUS ALTERANS may be given for any length of time, without injury to the patient.

SUCCUS ALTERANS is put up in pint round amber bottles and *never in bulk.*

PHYSICIANS who have not received DR. MCDADE'S latest publication, the MONOGRAPHIA SYPHILITICA, should send their address, mentioning this journal, and we will mail a copy. It contains a paper, illustrated with colored plates, by DR. D. H. GOODWILLIE, of New York, on the "Sequelæ o Syphilis," reports of cases in practice and many other valuable papers.

ELIXIR PURGANS.

ELIXIR PURGANS (LILLY) reliably stimulates the dormant liver without undue irritation, and has gentle yet positive effect upon the alimentary tract. In HABITUAL CONSTIPATION, so common in WOMEN AND CHILDREN, it will be found particularly useful. Its endorsement at Bellevue and many other prominent hospitals East and West, as well as its employment in general practice by the most eminent medical men, confirms the experience of years in its use.

Each Teaspoonful Represents	
Rhamnus Purshiana, -	10 grs.
Euonymus Atropur, - -	8 grs.
Cassia Acutifolia (Purif.) -	10 grs.
Iris Versicolor, - - -	4 grs.
Hyoscyamus Niger, - -	2 grs.
Aromatics, etc.	

IN PRESCRIBING, PLEASE BE CAREFUL TO WRITE

ELIXIR PURGANS (LILLY),

THAT OTHER PREPARATIONS MAY NOT BE SUBSTITUTED.

HIGHLY RECOMMENDED.

We take pleasure in endorsing the ELIXIR PURGANS (LILLY) as prepared from the above formula, for in it we find a near approach to positive *perfection* in the form of a *Liquid Cathartic*, and, from our experience with the preparation, can highly recommend it to the profession.

SUPPLIED BY ALL DRUGGISTS.

MALTINE.

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms, is the only Malt Preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides and the Iodides.

It deserves to stand in the front rank of constructives; and the constructives by their preventive, corrective, and curative power, are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may often be resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan and Dimmock, *only three* possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN, *Professor of Physiological Chemistry in Yale College.*

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe; and recent analysis made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—superior to all other Malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	**MALTINE** with Peptones.	**MALTINE** Ferrated.
MALTINE with Alteratives.	**MALTINE** with Pepsin & Pancreatine	**MALTO-YERBINE.**
MALTINE with Cod Liver Oil.	**MALTINE** with Phosphates, Iron Quinine and Strychnia.	**MALTO-VIBURNIN.**
MALTINE with Hypophosphites.		**MALTINE** with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "MALTINE" should be written, and not simply the words "Malt Extract" or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply the regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. INDISPENSABLE AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS

DARK — A NON-ALCOHOLIC LIQUID. — WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

Trinitrin (Nitro-Glycerin), 1-20, 1-25, 1-33, 1-50,, 1-100, and 1-200 gr.
Terpin Hydrate, - - 2, 3 and 5 grs.

ANTISEPTIC TABLETS,

7.7 Hydrarg. Chlor. Corros., 7.3 Ammonium Chloride.

More than six months since, we sent a circular to the drug trade, stating that we had discontinued the manufacture of the Antiseptic Tablets, introduced by us several years since at the suggestion of Dr. Charles Meigs Wilson, of this city. We have, however, received so many letters from physicians urging us to resume the manufacture, insisting that the Tablets prepared by us dissolved more readily and were more satisfactory than any substitute they had been able to procure, that we feel we could not ignore such persistent demands from our medical friends, who have found our tablets an absolute necessity. We have therefore concluded to again prepare them, in a building entirely separate from our main estabishment, with appliances and admirably devised protection by means of improved respirators, that will completely overcome any harmful effects to those engaged in their manufacture.

Druggists and physicians will be glad to learn that the Tablets as now prepared are perfectly white and free from the coloring matter that we formerly added. This was done to lessen the danger of their being taken, or used in mistake; to guard against any such possibility, each Tablet, as now made, has the word "POISON" stamped upon it.

JOHN WYETH & BROTHER,

CHEMISTS, PHILADELPHIA.

Actual Specimens from Our Letter Box.

One kind of letter:—

....“ I wouldn't have your journal at any price.”

A rather pleasanter one :—

....“I have taken the REPORTER for five years, through L——'s Pharmacy, of St. Louis. Please see if they have not paid for me this year. If not, I will forward remittance; for, though your journal gives homœopathy many hard ‘raps,’ which are generally maliciously false, it is nevertheless the best journal published, and I cannot do without it.”

Another pleasant one:—

....“I feel very kindly toward the old, reliable MEDICAL AND SURGICAL REPORTER, and am constantly running across physicians who are and have been taking it, and who think they could hardly practice medicine without it. Being devoted to the interests of the general practitioner, and being constantly filled with interesting matter to that large majority of the profession, and with its fearless and live editorials on all leading topics, it ably fills its sphere, and makes a large army of friends; and, what is better, it keeps them, as is evidenced by the fact that almost every practitioner of middle age who takes this journal has large numbers of them filed away. * * * * As one whose preceptor was an old friend and subscriber to it, and who has himself been benefited and guided by its weekly appearance for some years, I wish it such renewed prosperity as shall place it at the highest pinnacle of medical literature.”

☞We will send the REPORTER to any NEW SUBSCRIBER for the remainder of this year for the sum of TWO DOLLARS.

Address,

Medical and Surgical Reporter,

P. O. Box 843. PHILADELPHIA.

CARNRICK'S SOLUBLE FOOD

IS UNLIKE ANY OTHER INFANTS' FOOD THAT HAS EVER BEEN PRODUCED.

THE FORMULA.

℞

Partially Predigested Milk Solids,	**45 parts.**
Wheat, with the Starch converted into Dextrin,	**45 "**
Milk Sugar,	**10 "**

We do not claim this food to be a "perfect substitute for human milk." But we do claim that Carnrick's Food approaches nearer to human milk in constituents and digestibility than any other food that has ever been produced, and that it is the only infants' food that will, without the addition of cow's milk, thoroughly nourish a child from its birth.

We believe that Carnrick's Food solves the problem of a reliable substitute for human milk. The Casein of cows' milk, by partial predigestion with freshly made Pancreatine, is rendered as easily digestible by the infant as human milk.

We have never published an analysis of Carnrick's Food "prepared with milk," for, unlike all other foods, it is prepared by the addition of water only, and we base our claims upon the intrinsic value of the food as compared with an equal amount of the solid constituents of human milk. All other analyses or comparisons are misleading. We challenge similar comparisons with any other food and confidently believe, that if Carnrick's Food is depended upon for the nutrition of infants, the great mortality among children will be reduced.

Full information regarding the process of manufacture will be cheerfully furnished and samples sent free to those who wish to test Carnrick's Food.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.

THE

PROVIDENT LIFE AND TRUST COMPANY,

OF PHILADELPHIA,

Office, No. 409 Chestnut Street,

INCORPORATED, Third Month 22, 1865. CHARTER PERPETUAL.

CAPITAL, $1,000,000. ASSETS, $20,115,023.49.

INSURES LIVES, GRANTS ANNUITIES, RECEIVES MONEY ON DEPOSIT, returnable on demand, for which interest is allowed, and is empowered by law to act as EXECUTOR, ADMINISTRATOR, TRUSTEE, GUARDIAN, ASSIGNEE, COMMITTEE, RECEIVER, AGENT, &c., for the faithful performance of which its capital and surplus fund furnish ample security.

ALL TRUST FUNDS and INVESTMENTS ARE KEPT SEPARATE AND APART from the assets of the Company.

OWNERS OF REAL ESTATE are invited to look into that branch of the Trust Department which has the care of this description of property. It is presided over by an officer learned in the law of Real Estate, seconded by capable and trustworthy assistants. Some of them give their undivided attention to its care and management.

The incomes of parties residing abroad carefully collected and duly remitted.

FELS'S GERMICIDE SOAP.

Fels & Co.
Philadelphia.

1151 N. THIRD STREET.

This certifies that I am familiar with the composition and method of manufacture of Fels's Germicide Soap, and that it is prepared with Naphthols, Eucalyptol, Methyl Salicylate, together with Mercuric Chloride, the last combined with the soap mass by a new process which preserves the antiseptic and germicide value.

Actual tests of this soap on culture fluids have shown a direct antiseptic and germicide power.

For Cleansing Instruments, Sponges, etc.

For Purification of Wounds, Sores.

For Personal Disinfection of Physician and Nurse.

For Skin Troubles Requiring Antiseptic Treatment, etc., etc.

Can be had of druggists, or cakes mailed on receipt of 25 cts.

HYDROLEINE

(HYDRATED OIL)

FOR CONSUMPTION and WASTING DISEASES,

Produces Immediate Increase in Flesh and Weight.

FORMULA.

Each Dose of Two Teaspoonfuls equal to 120 Drops, contains:

Pure Cod Liver Oil...80 m. (drops)	Soda.....1.3 Grains.
Distilled Water.....35 "	Salicylic Acid.....1.4 "
Soluble Pancreatin.. 5 Grains.	Hyocholic Acid.....1.20 "

DOSE.—Two teaspoonfuls alone, or with twice the quantity of water to be taken thrice daily after meals.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhua, but a hydro-pancreated preparation containing acids and a modicum of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used completely saponifies the oleaginous material so necessary to the reparative process in all wasting diseases.

Each bottle in nutritive value exceeds ten times the same bulk of cod liver oil. It is economical in use and certain in results.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," by H. C. BARTLETT, Ph.D., F. C. S., *and the experiments which were made, together with cases illustrating the effect of Hydrated Oil in practice, are concisely stated in a Treatise on "Consumption and Wasting Diseases," by* G. OVEREND DREWRY, M.D. *Copies of these works sent free on application.*

SOLD AT ALL DRUG STORES, AT $1.00 PER BOTTLE.

C. N. CRITTENTON,

Sole Agent for the United States. **115 FULTON ST., NEW YORK.**

A sample of Hydroleine will be sent free upon application, to any physician (inclosing business card) in the United States.

St. Louis College of Physicians and Surgeons.

The Ninth Academical year begins on September 1st and terminates on the last Saturday of May prox., comprising preliminary, regular and spring courses. The first and third optional. The regular session opens on the second Monday of October, continuing twenty weeks. The spring course offers all the opportunities of post-graduate instruction, inclusive of dissection, operations on cadaver, etc. Licensed practitioners by examination before Examining Boards or Boards of Health admitted to the graduating class. *Ad Eundem* degrees granted to graduates of two years standing by attending portion of regular course, and passing practical examination.

Fees for Academical Year,	**$50.00.**
Matriculation,	**5.00, paid but once.**
Graduation Examination,	**25.00, not returnable.**

Abundant anatomical material at nominal prices for anatomical, pathological and operative pursuits. Abundant clinical material in all branches, inclusive. Practical obstetrics.

For announcement and particulars, apply to

We submit it to the test of actual use, and a call at our office for purposes of examination is invited at any time.

WHEELER & EVANS, SOLE AGENTS,

No. 416 Walnut St., Philadelphia.

McARTHUR'S SYRUP.

(SYR: HYPOPHOS: COMP: C. P. McARTHUR.)

Its use is indicated in Consumption and Tuberculosis, Diseases of the Chest, Chronic Cough, Throat Affections, General Debility, Brain Exhaustion, Impotence and Loss of Memory.

The point of primary importance in the use of the Hypophosphites is their *chemical* purity, but unfortunately they are too often adulterated.

So little seems to be generally known, even among the medical profession, with regard to the chemistry of the Hypophosphites, and the absolute necessity of CHEMICAL purity, that we call attention to this point.

One of the first effects produced by the use of our CHEMICALLY PURE Hypophosphites is a general increase of nervous energy, with a feeling of ease and comfort.

The second effect is an increase of appetite; digestion is improved, and the bowels become regular in their action, the quantity and color of the blood is increased, respiration is controlled, a better expansion of the chest is observed, cough improves, easy expectoration is produced, night perspiration diminishes, the face becomes fuller, the lips red, the nails and hair grow, and in children the teeth, showing the importance of the Hypophosphites on the organ of nutrition.

☞ Physicians when prescribing will please write thus:

℞ SYR: HYPOPHOS: COMP: McARTHUR. ONE BOTTLE.

As it is made *only for physicians* there are no printed wrappers or advertisements about the bottle.

Our pamphlet on the **CURABILITY AND TREATMENT OF CONSUMPTION,** sent free to physicians upon application.

We will send one bottle of McArthur's Syrup to any physician, without charge, who will pay the express charges on the same.

Mention this Journal. McARTHUR HYPOPHOSPHITE CO., BOSTON, Mass.

LENTZ'S NEW COMPACT OPERATING SET, No. 10

One Amputating Knife (Leg and Arm). One Finger Knife. One Hernia Knife. One Sharp Curved Bistoury. Two Scalpels. One Tenotome. One Tenaculum. One pair Scissors, curved or flat. One Saw, 9-inch blade. One Liston's Spring Bone Forceps. One Artery and Needle Forceps, improved. One Dressing Forceps. One Esmarch's Flat Rubber Tourniquet, with Chain. One Director, with Aneurism Needle. Two Silver Probes. Silk, Wire, Wax and Needles.

The above instruments are put up in a fine Morocco Case, with nickel trimmings, lined with velvet, and has extra space for Trephine and Elevator, if desired. With the *sixteen* instruments contained in this case any ordinary operation may be performed.

Size, 11 in. long, 4 in. wide, 2 in. high.
Price, - - - - $25.00

We also make the above case with hard rubber antiseptic handles on knives and saw. Price, - $29.00

Discount 25 per cent. to Physicians

Our New Catalogue of 260 pages will be sent on receipt of 10 cents for postage.

Friedrichshall.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of considerably greater strength and efficacy than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"*The most suitable aperient for prolonged use.*"—Prof. SEEGEN.

"*After twenty years' use I appreciate it as highly as ever.*"—Prof. VIRCHOW.

OF ALL DRUGGISTS AND MINERAL WATER DEALERS.

YOU WILL FIND **BROMO-CAFFEINE** OF GREATEST SERVICE IN

OF ALL TYPES **NERVOUS HEADACHES** OF ALL TYPES

Headaches from Loss of Sleep, Physical Fatigue, Excessive Study, Mental Anxiety, Neurasthenia, Dysmenorrhœa, Pregnancy, or other Ovarian Irritation. Relieves Insomnia, and is very useful in Asthma, Whooping Cough and Nervous Cough. Prevents Tinnitis Aurium during the administration of Quinine. Cures Sea Sickness, Quiets the Restlessness of Alcoholism, Morphia Craving, &c. Relieves Anxiety and Promotes Sleep.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH — Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞ Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. INDISPENSABLE AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS
DARK — A NON-ALCOHOLIC LIQUID. — WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

In corresponding with Advertisers, please mention THE MEDICAL AND SURGICAL REPORTER.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

—SPECIAL FORMULÆ TO ORDER.—

Avoid Cheap Imitations by Always Specifying "SEABURY'S" or "S. & J."

Actual Specimens from Our Letter Box.

One kind of letter:—

....“ I wouldn't have your journal at any price.”

A rather pleasanter one:—

....“I have taken the REPORTER for five years, through L——'s Pharmacy, of St. Louis. Please see if they have not paid for me this year. If not, I will forward remittance; for, though your journal gives homœopathy many hard ‘raps,’ which are generally maliciously false, it is nevertheless the best journal published, and I cannot do without it.”

Another pleasant one:—

....“I feel very kindly toward the old, reliable MEDICAL AND SURGICAL REPORTER, and am constantly running across physicians who are and have been taking it, and who think they could hardly practice medicine without it. Being devoted to the interests of the general practitioner, and being constantly filled with interesting matter to that large majority of the profession, and with its fearless and live editorials on all leading topics, it ably fills its sphere, and makes a large army of friends; and, what is better, it keeps them, as is evidenced by the fact that almost every practitioner of middle age who takes this journal has large numbers of them filed away. * * * * As one whose preceptor was an old friend and subscriber to it, and who has himself been benefited and guided by its weekly appearance for some years, I wish it such renewed prosperity as shall place it at the highest pinnacle of medical literature.”

☞We will send the REPORTER to any NEW SUBSCRIBER for the remainder of this year for the sum of TWO DOLLARS.

Address,

The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

SPECIFY (BATTLE) WHEN PRESCRIBING OUR PREPARATIONS.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

P. O. Box 843. PHILADELPHIA.

In corresponding with Advertisers, please mention THE MEDICAL AND SURGICAL REPORTER.

CELERINA

NERVE-TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid-Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Impotency, Spermatorrhea, Loss of Nerve-Power (so usual with Lawyers, Preachers, Writers and Business Men), Nervous Headache, Neuralgia, Paralysis, Dysmenorrhea, Hysteria, Opium-Habit, Inebriety, Prostatitis, Dyspepsia, and ALL LANGUID or DEBILITATED conditions of the System.—*Indispensable to restore a patient after alcoholic excess.*

DOSE.—One or two teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation,

IT RESTORES NORMAL ACTION TO THE UTERUS, AND IMPARTS VIGOR TO THE ENTIRE UTERINE SYSTEM.

☞Where Women have aborted during previous Pregnancies, or in any case where abortion is feared, the Aletris Cordial is indicated, and should be continuously administered during entire gestation.

ACID MANNATE

A MILD, SAFE AND PLEASANT APERIENT.

Prepared from Manna, Purified Cathartic Acid, and Fruit Juices.

INDICATIONS.—Constipation, Biliousness, Congestions, Etc. INDISPENSABLE AS AN APERIENT FOR WOMEN DURING PREGNANCY. In teaspoonful doses, 3 times a day, it favors the SECRETION and EXCRETION of bile, and gradually removes the congested and torpid states of the liver, and keeps the bowels in a regular and soluble condition.

DOSE.—ONE or MORE teaspoonfuls as directed by the Physician.

S. H. KENNEDY'S
CONCENTRATED EXTRACT OF
PINUS CANADENSIS
DARK A NON-ALCOHOLIC LIQUID. WHITE

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be Used.

Recommended by DR. J. MARION SIMS, and other Prominent Physicians.

Handsomely ruled in red and blue, and printed in black, on fine ledger paper. Bound in black cloth, with leather back and corners. OPENS OUT FLAT. 300 pages and index. Space for over 2000 accounts.

PRICE - $4.00.

Address, Drs. RANDOLPH & DULLES.

P. O. Box 843, Philadelphia.

Actual Specimens from Our Letter Box.

One kind of letter:—

....“ I wouldn't have your journal at any price.”

A rather pleasanter one:—

....“I have taken the REPORTER for five years, through L——'s Pharmacy, of St. Louis. Please see if they have not paid for me this year. If not, I will forward remittance; for, though your journal gives homœopathy many hard ‘raps,’ which are generally maliciously false, it is nevertheless the best journal published, and I cannot do without it.”

Another pleasant one:—

....“I feel very kindly toward the old, reliable MEDICAL AND SURGICAL REPORTER, and am constantly running across physicians who are and have been taking it, and who think they could hardly practice medicine without it. Being devoted to the interests of the general practitioner, and being constantly filled with interesting matter to that large majority of the profession, and with its fearless and live editorials on all leading topics, it ably fills its sphere, and makes a large army of friends; and, what is better, it keeps them, as is evidenced by the fact that almost every practitioner of middle age who takes this journal has large numbers of them filed away. * * * * As one whose preceptor was an old friend and subscriber to it, and who has himself been benefited and guided by its weekly appearance for some years, I wish it such renewed prosperity as shall place it at the highest pinnacle of medical literature.”

☞We will send the REPORTER to any NEW SUBSCRIBER for the remainder of this year for the sum of TWO DOLLARS.

Address,

Medical and Surgical Reporter,

P. O. Box 843. PHILADELPHIA.

LENTZ'S

NEW COMPACT

Operating Set.

No. 10.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

This certifies that I am familiar with the composition and method of manufacture of Fels's Germicide Soap, and that it is prepared with Naphthols, Eucalyptol, Methyl Salicylate, together with Mercuric Chloride, the last combined with the soap mass by a new process which preserves the antiseptic and germicide value.

Actual tests of this soap on culture fluids have shown a direct antiseptic and germicide power.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

An Invaluable Aid in the Treatment of all Cases of Debility.

☞ ESTABLISHED 15 YEARS. ☞ ENDORSED BY SCORES OF PHYSICIANS. ☞ BEWARE OF IMITATIONS.

☞ ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, Soluble Citrate of Iron, Cinchona, Gentian, and simple aromatics. An official analysis of this preparation by the eminent chemist, ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement of by Sir ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

In the treatment of all cases of Debility, Convalescence from severe illness, Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Lack of Nerve Tone, and of the Alcohol and Opium Habits, and all maladies requiring a Tonic Nutrient, it is superior to all other preparations.

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion, and gives to weakened individuals that first prerequisite to improvement, an appetite.—By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label WITH IRON, "No. 1;" while the same preparation, WITHOUT IRON, is designated on the label as "No. 2."

☞ *I will, upon application, send a sample bottle of* COLDEN'S LIQUID BEEF TONIC *to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention* "COLDEN'S," *viz.,* "EXT. CARNIS FL. COMP. (COLDEN)." *It is put up in pint bottles, and* CAN BE HAD OF WHOLESALE AND RETAIL DRUGGISTS GENERALLY THROUGHOUT THE UNITED STATES.

C. N. CRITTENTON, Sole Agent, 115 Fulton Street, New York.

GLENN'S SULPHUR SOAP.

All physicians know the great value of the local use of Sulphur in the TREATMENT OF DISEASES OF THE SKIN. GLENN'S SULPHUR SOAP is the ORIGINAL and BEST combination of its kind, and the one now generally used. For sale by all Druggists at 25 cents a cake, or three cakes for 60 cents. Beware of counterfeits.

CONSTANTINE'S PINE TAR SOAP.

BY FAR THE BEST TAR SOAP MADE. Has been on trial among physicians for very many years as a toilet soap and healing agent, and its superior virtues have been unanimously conceded in ALL CASES WHERE THE USE OF TAR IS INDICATED.

Unsolicited expressions of its excellence have been received from the Medical Faculty generally. None genuine unless stamped "A. A. Constantine's Persian Healing Pine Tar Soap." For sale by all Druggists.

Wholesale Depot, C. N. CRITTENTON, 115 Fulton Street, New York.

Please mention this Journal. ☞ Samples of above Soaps SENT FREE on application to any physician enclosing card.

St. Louis College of Physicians and Surgeons.

The Ninth Academical year begins on September 1st and terminates on the last Saturday of May prox., comprising preliminary, regular and spring courses. The first and third optional. The regular session opens on the second Monday of October, continuing twenty weeks. The spring course offers all the opportunities of post-graduate instruction, inclusive of dissection, operations on cadaver, etc. Licensed practitioners by examination before Examining Boards or Boards of Health admitted to the graduating class. *Ad Eundem* degrees granted to graduates of two years standing by attending portion of regular course, and passing practical examination.

Fees for Academical Year,	**$50.00.**
Matriculation,	**5.00, paid but once.**
Graduation Examination,	**25.00, not returnable.**

Abundant anatomical material at nominal prices for anatomical, pathological and operative pursuits. Abundant clinical material in all branches, inclusive. Practical obstetrics.

WHEELER & EVANS, SOLE AGENTS,
No. 416 Walnut St., Philadelphia.

McARTHUR'S SYRUP.

(SYR: HYPOPHOS: COMP: C. P. McARTHUR.)

Its use is indicated in Consumption and Tuberculosis, Diseases of the Chest, Chronic Cough, Throat Affections, General Debility, Brain Exhaustion, Impotence and Loss of Memory.

The point of primary importance in the use of the Hypophosphites is their *chemical* purity, but unfortunately they are too often adulterated.

So little seems to be generally known, even among the medical profession, with regard to the chemistry of the Hypophosphites, and the absolute necessity of CHEMICAL purity, that we call attention to this point.

One of the first effects produced by the use of our CHEMICALLY PURE Hypophosphites is a general increase of nervous energy, with a feeling of ease and comfort.

The second effect is an increase of appetite; digestion is improved, and the bowels become regular in their action, the quantity and color of the blood is increased, respiration is controlled, a better expansion of the chest is observed, cough improves, easy expectoration is produced, night perspiration diminishes, the face becomes fuller, the lips red, the nails and hair grow, and in children the teeth, showing the importance of the Hypophosphites on the organ of nutrition.

☞ Physicians when prescribing will please write thus:

℞ SYR: HYPOPHOS: COMP: McARTHUR. ONE BOTTLE.

As it is made *only for physicians* there are no printed wrappers or advertisements about the bottle.

Our pamphlet on the **CURABILITY AND TREATMENT OF CONSUMPTION,** sent free to physicians upon application.

We will send one bottle of McArthur's Syrup to any physician, without charge, who will pay the express charges on the same.

Mention this Journal. McARTHUR HYPOPHOSPHITE CO., BOSTON, Mass.

Food in Cholera Infantum

and the

Summer Diarrhœa of Infants.

The food of an infant, ill with cholera infantum or summer diarrhœa, is a matter of the highest importance, and it is now well known that until milk in every form has been strictly excluded from the diet, no relief can be expected. Experience has proved that MELLIN'S FOOD, dissolved in water only, is the best diet in these diseases; given cold and in small amounts frequently repeated, the stomach will retain it without trouble. The great difficulty in the treatment of these complaints is thus immediately overcome, for the child will be nourished and its strength maintained. When convalescence has been established, milk, at first in small amount, can be added to the Mellin's Food, and gradually increased as the child is found to bear it.

A sample of MELLIN'S FOOD, *sufficient for trial, will be sent to any physician upon application.*

Doliber, Goodale & Co., Boston, Mass.

Friedrichshall.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of considerably greater strength and efficacy than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—Prof. SEEGEN.

"After twenty years' use I appreciate it as highly as ever."—Prof. VIRCHOW

FELLOWS'

HYPO-PHOS-PHITES

(SYR: HYPOPHOS: COMP: FELLOWS)

Contains **The essential elements** to the Animal Organization—Potash and Lime.

The **Oxydizing Agents**—Iron and Manganese;

The **Tonics**—Quinine and Strychnine;

And the **Vitalizing Constituent**—Phosphorus,

Combined in the form of a Syrup, with *slight alkaline reaction.*

It Differs in Effect from all others, being pleasant to taste, acceptable to the stomach, and harmless under prolonged use.

It has Sustained a High Reputation in America and England for efficiency in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs, and is employed also in various nervous and debilitating diseases with success.

Its Curative Properties are largely attributable to Stimulant, Tonic, and Nutritive qualities, whereby the various organic functions are recruited.

In Cases where innervating constitutional treatment is applied, and tonic treatment is desirable, this preparation will be found to act with safety and satisfaction.

Its Action is Prompt; stimulating the appetite and the digestion, it promotes assimilation, and enters directly into the circulation with the food products.

The Prescribed Dose produces a feeling of buoyancy, removing depression or melancholy, and hence is of great value in the treatment of MENTAL AND NERVOUS AFFECTIONS.

From its exerting a double tonic effect and influencing a healthy flow of the secretions, its use is indicated in a wide range of diseases.

Prepared by JAMES I. FELLOWS, Chemist,

48 VESEY STREET, NEW YORK.

Circulars Sent to Physicians on Application.

FOR SALE BY ALL DRUGGISTS.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

SUCCUS ALTERANS

(McDADE.)

SUCCUS ALTERANS is a purely vegetable compound of the preserved juices of Stillingia Sylvatica Lappa Minor, Phytolacca Decandra, Smilax Sarsaparilla and Xanthoxylum Carolinianum, as collected by Dr. Geo. W. McDade exclusively for Eli Lilly & Co., and endorsed by Dr. J. Marion Sims.

SUCCUS ALTERANS continues to gain favor from its remarkable Alterative and Tonic properties, *eliminating specific poison from the blood* and *increasing the proportion of red corpuscles in anæmic patients* to a wonderful degree; is endorsed by the medical profession and in use by many hospitals of note.

SUCCUS ALTERANS in venereal and cutaneous diseases is fast supplanting Mercury, the Iodides and Arsenic; and is a certain remedy for Mercurialization, Iodism and the dreadful effects often following the use of Arsenic in skin diseases.

SUCCUS ALTERANS is also strongly recommended for its Tonic and Alterative effects in myriad forms of scrofulous disease, and in all cases where anæmia is a factor. Such patients rapidly develop a good appetite, sleep soundly and gain flesh rapidly. Many cases are on record where patients increased ten to twenty-five pounds in weight in a few weeks.

SUCCUS ALTERANS is giving satisfactory results in treatment of *Chronic Rheumatism* and can be used with confidence.

SUCCUS ALTERANS may be given for any length of time, without injury to the patient.

SUCCUS ALTERANS is put up in pint round amber bottles and *never in bulk.*

PHYSICIANS who have not received Dr. McDade's latest publication, the Monographia Syphilitica, should send their address, mentioning this journal, and we will mail a copy. It contains a paper, illustrated with colored plates, by Dr. D. H. Goodwillie, of New York, on the "Sequelæ o Syphilis," reports of cases in practice and many other valuable papers.

ELIXIR PURGANS.

Elixir Purgans (Lilly) reliably stimulates the dormant liver without undue irritation, and has gentle yet positive effect upon the alimentary tract. In Habitual Constipation, so common in Women and Children, it will be found particularly useful. Its endorsement at Bellevue and many other prominent hospitals East and West, as well as its employment in general practice by the most eminent medical men, confirms the experience of years in its use.

Each Teaspoonful Represents	
Rhamnus Purshiana, -	10 grs.
Euonymus Atropur., - -	8 grs.
Cassia Acutifolia (Purif.) -	10 grs.
Iris Versicolor, - - -	4 grs.
Hyoscyamus Niger, - -	2 grs.
Aromatics, etc.	

IN PRESCRIBING, PLEASE BE CAREFUL TO WRITE

ELIXIR PURGANS (LILLY),

THAT OTHER PREPARATIONS MAY NOT BE SUBSTITUTED.

HIGHLY RECOMMENDED.

We take pleasure in endorsing the Elixir Purgans (Lilly) as prepared from the above formula, for in it we find a near approach to positive *perfection* in the form of a *Liquid Cathartic*, and, from our experience with the preparation, can highly recommend it to the profession.

SUPPLIED BY ALL DRUGGISTS.

MALTINE.

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms, is the only Malt Preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides and the Iodides.

It deserves to stand in the front rank of constructives; and the constructives by their preventive, corrective, and curative power, are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may often be resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan and Dimmock, *only three* possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. R. H. CRITTENDEN, *Professor of Physiological Chemistry in Yale College.*

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe; and recent analysis made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—superior to all other Malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	**MALTINE** with Peptones.	**MALTINE** Ferrated.
MALTINE with Alteratives.	**MALTINE** with Pepsin & Pancreatine	**MALTO-YERBINE.**
MALTINE with Cod Liver Oil.	**MALTINE** with Phosphates, Iron Quinine and Strychnia.	**MALTO-VIBURNIN.**
MALTINE with Hypophosphites.		**MALTINE** with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "MALTINE" should be written, and not simply the words "Malt Extract" or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply the regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

No. 7 South Eleventh St., Philadelphia.

CARNRICK'S SOLUBLE FOOD

IS UNLIKE ANY OTHER INFANTS' FOOD THAT HAS EVER BEEN PRODUCED.

℞

THE FORMULA.

Partially Predigested Milk Solids,	**45 parts.**
Wheat, with the Starch converted into Dextrin,	**45 "**
Milk Sugar,	**10 "**

We do not claim this food to be a "perfect substitute for human milk." But we do claim that Carnrick's Food approaches nearer to human milk in constituents and digestibility than any other food that has ever been produced, and that it is the only infants' food that will, without the addition of cow's milk, thoroughly nourish a child from its birth.

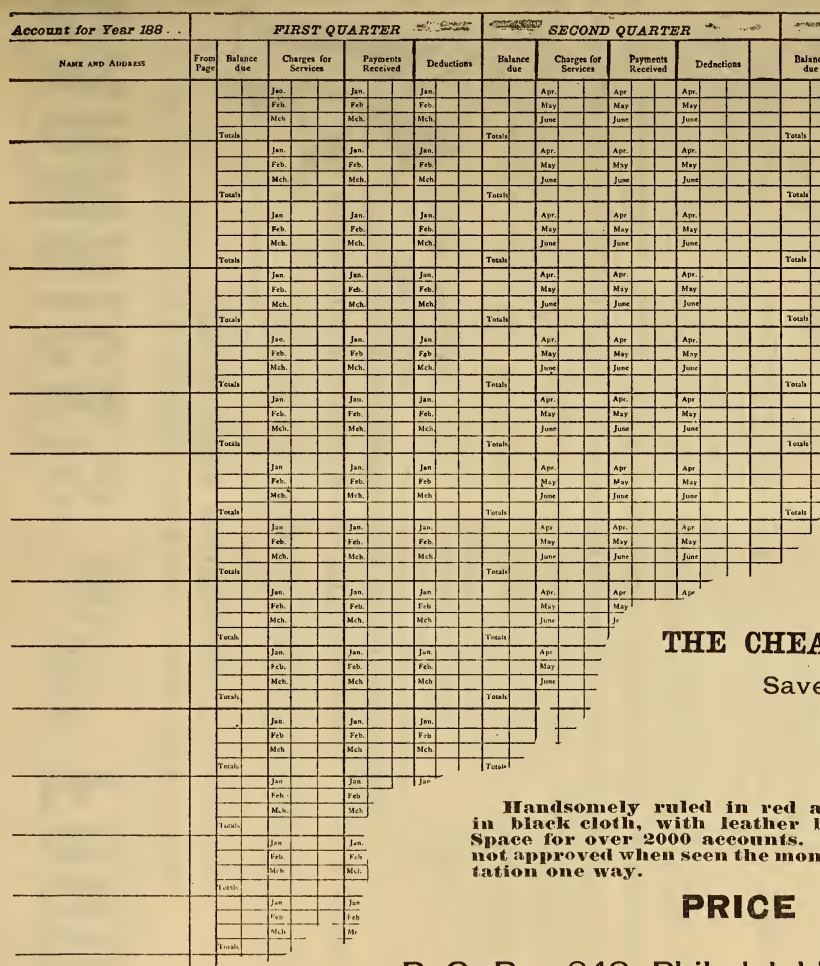
We believe that Carnrick's Food solves the problem of a reliable substitute for human milk. The Casein of cows' milk, by partial predigestion with freshly made Pancreatine, is rendered as easily digestible by the infant as human milk.

We have never published an analysis of Carnrick's Food "prepared with milk," for, unlike all other foods, it is prepared by the addition of water only, and we base our claims upon the intrinsic value of the food as compared with an equal amount of the solid constituents of human milk. All other analyses or comparisons are misleading. We challenge similar comparisons with any other food and confidently believe, that if Carnrick's Food is dependedupon for the nutrition of infants, the great mortality among children will be reduced.

Full information regarding the process of manufacture will be cheerfully furnished and samples sent free to those who wish to test Carnrick's Food.

REED & CARNRICK,

—NEW YORK.—



Reduced Specimen of Two Pages (one folio) of

THE MODEL LEDGER

THE CHEAPEST AND BEST LEDGER IN THE MARKET.

THE COATING OF THE FOLLOWING PILL WILL DISSOLVE IN 4½ MINUTES.

PIL: CHALYBEATE.

(Carbonate and the Protoxide of Iron.)

ORDER IT IN THE ORIGINAL BOTTLE.

PIL: CHALYBEATE COMP. (WARNER & CO.)

Nux Vomica is added as an ingredient to Pill Chalybeate to increase the tonic effect when desired.
Composition of each Pill.—℞ (Chalybeate Mass.), Carb. Protoxide of Iron, gr. 2½., Ext. Nuc. Vom. gr. 1-6.

DOSE—1 to 3 Pills.

Most advantageously employed in the treatment of Anæmia, Chlorosis, Phthisis, Scrofula, Loss of Appetite, etc.

PIL: ANTISEPTIC.

Each Pill contains: Sulphite Soda, 1 gr. Salicylic Acid, 1 gr. Ext. Nuc. Vomica, ¼ gr.

DOSE.—1 to 3 Pills.

Pil. Antiseptic is prescribed with great advantage in cases of Dyspepsia attended with acid stomach and enfeebled digestion following excessive indulgence in eating or drinking. It is used with advantage in Rheumatism.

Prepared by WARNER & CO.

Supplied upon physician's prescription by all leading druggists.

PIL: ANTISEPTIC COMP.

(WARNER & CO.)

Each Pill contains: Sulphite Soda, 1 gr. Salicylic Acid, 1 gr. Ext. Nuc. Vomica, ⅛ gr. Powd. Capsicum, 1-10 gr. Conc't Pepsin, 1 gr.

DOSE—1 to 3 Pills.

Pil. Antiseptic Comp. are prescribed with great advantage in cases of Dyspepsia, Indigestion, and malassimilation of food.

Fels's Germicide Soap.

This certifies that I am familiar with the composition and method of manufacture of Fels's Germicide Soap, and that it is prepared with Naphthols, Eucalyptol, Methyl Salicylate, together with Mercuric Chloride, the last combined with the soap mass by a new process which preserves the antiseptic and germicide value.

Actual tests of this soap on culture fluids have shown a direct antiseptic and germicide power.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases. Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

JUST OUT!!

Third Edition, Revised, Enlarged, Illustrated.

ACCIDENTS AND EMERGENCIES.

BY CHARLES W. DULLES, M.D.

"This is the third edition, with revisions and enlargements, of an excellent manual, the practical qualities of which have been proven many times. It is a work that ought to be in every home, and every home that has a copy kept where it can be consulted at short notice is likely to find it worth many times its small cost."—*Philadelphia Evening Telegraph*, May 5, 1888.

"The illustrations are good and sufficiently numerous. The language is simple, being entirely devoid of technicalities, and the methods of treatment recommended are trustworthy and reliable. The manual is one of the best of this class of books, and should be in the library of every householder, ready for reference at a moment's notice."—*Science*, May 18, 1888.

Sent on Receipt of 75 Cents.

ADDRESS: **Drs. RANDOLPH & DULLES,**

COMPRESSED TABLETS.

WE ask the attention of Physicians to the annexed list of recent additions of Compressed Tablets, as we think all of them are well deserving the careful attention of practitioners. We would be pleased to send to any physician, circular matter, compiled with great care and accuracy, giving therapeutic value and results in a concise form, which we are confident will be of interest, and possibly, of advantage to medical men who have not yet had access to the foreign and home authorities, from which we have culled the information we give.

Acid Boracic, - - - - 5 grs.
Acetanilide, - - - 3 and 5 "
Antifebrin, - - - 3 " 5 "
Antipyrine, - - - 3, 5 and 10 "
Blaud's
Ferri. Sulph. Exsic., 2 grs., Potass. Carb., 1 4-5 grs., Sacch. Alb., $1\frac{2}{3}$ grs.
Iodol. - - - $\frac{1}{2}$, 1, 2, 3, and 5 grs.
Manganese Binoxide, : - 1 " 2 "
Opium, Camphor and Carb. Ammon., (Opium Denarcot. $\frac{1}{2}$ gr., Camphor, 2 grs., Ammon Carb., $2\frac{1}{2}$ grs.)
Quiniæ Tannate, and Chocolate 1 grain, (Quiniæ Tannat. 1 gr., Ext. Cacao, 9 grs.)
Quiniæ Tannate and Chocolate, $2\frac{1}{2}$ grs., (Quiniæ Tannat. $2\frac{1}{2}$ grs., Ext. Cacao, $7\frac{1}{2}$ grs.)
Salol, - - - - $2\frac{1}{2}$ and 5 grs.
Sodium Succinate, . . 2 " 5 "
Thalline Sulphate, - - 2, 3 " 5 "
Trinitrin (Nitro-Glycerin), 1-20, 1-25, 1-33, 1-50, 1-100, and 1-200 gr.
Terpin Hydrate, - - 2, 3 and 5 grs.

ANTISEPTIC TABLETS,

7.7 Hydrarg. Chlor. Corros., 7.3 Ammonium Chloride.

More than six months since, we sent a circular to the drug trade, stating that we had discontinued the manufacture of the Antiseptic Tablets, introduced by us several years since at the suggestion of Dr. Charles Meigs Wilson, of this city. We have, however, received so many letters from physicians urging us to resume the manufacture, insisting that the Tablets prepared by us dissolved more readily and were more satisfactory than any substitute they had been able to procure, that we feel we could not ignore such persistent demands from our medical friends, who have found our tablets an absolute necessity. We have therefore concluded to again prepare them, in a building entirely separate from our main estabishment, with appliances and admirably devised protection by means of improved respirators, that will completely overcome any harmful effects to those engaged in their manufacture.

Druggists and physicians will be glad to learn that the Tablets as now prepared are perfectly white and free from the coloring matter that we formerly added. This was done to lessen the danger of their being taken, or used in mistake; to guard against any such possibility, each Tablet, as now made, has the word "POISON" stamped upon it.

LETTERS.

One kind of letter:—

....“ I wouldn't have your journal at any price.”

A rather pleasanter one:—

....“I have taken the REPORTER for five years, through L——'s Pharmacy, of St. Louis. Please see if they have not paid for me this year. If not, I will forward remittance; for, though your journal gives homœopathy many hard ‘raps,’ which are generally maliciously false, it is nevertheless the best journal published, and I cannot do without it.”

Another pleasant one:—

....“I feel very kindly toward the old, reliable MEDICAL AND SURGICAL REPORTER, and am constantly running across physicians who are and have been taking it, and who think they could hardly practice medicine without it. Being devoted to the interests of the general practitioner, and being constantly filled with interesting matter to that large majority of the profession, and with its fearless and live editorials on all leading topics, it ably fills its sphere, and makes a large army of friends; and, what is better, it keeps them, as is evidenced by the fact that almost every practitioner of middle age who takes this journal has large numbers of them filed away. * * * * As one whose preceptor was an old friend and subscriber to it, and who has himself been benefited and guided by its weekly appearance for some years, I wish it such renewed prosperity as shall place it at the highest pinnacle of medical literature.”

☞We will send the REPORTER to any NEW SUBSCRIBER for the remainder of this year for the sum of TWO DOLLARS.

Address,

Medical and Surgical Reporter,

P. O. Box 843. PHILADELPHIA.

LENTZ'S

NEW COMPACT

Operating Set,

No. 10.

One Amputating Knife (Leg and Arm) One Finger Knife. One Hernia Knife. One Sharp Curved Bistoury. Two Scalpels. One Tenotome. One Tenaculum. One pair Scissors, curved or flat. One Saw, 9-inch blade. One Liston's Spring Bone Forceps. One Artery and Needle Forceps, improved. One Dressing Forceps. One Esmarch's Flat Rubber Tourniquet, with Chain. One Director with Aneurism Needle. Two Silver Probes. Silk, Wire, Wax and Needles.

The above instruments are put up in a fine Morocco Case, with nickel trimmings, lined with velvet, and has extra space for Trephine and Elevator, if desired. With the *sixteen* instruments contained in this case any ordinary operation may be performed.

Size, 11 in. long, 4 in. wide, 2 in. high.

Price, $25. With Trephine and Handle, and Trephine Elevator in addition, $29.65. We also make the above case with hard rubber antiseptic handles on knives and saw. Price, $29.00. With Trephine and Elevator in addition, $33.65.

Discount 25 per cent. to Physicians

Our New Catalogue of 260 pages will be sent on receipt of 10 cents for postage.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

Fels's Germicide Soap.

This certifies that I am familiar with the composition and method of manufacture of Fels's Germicide Soap, and that it is prepared with Naphthols, Eucalyptol, Methyl Salicylate, together with Mercuric Chloride, the last combined with the soap mass by a new process which preserves the antiseptic and germicide value.

Actual tests of this soap on culture fluids have shown a direct antiseptic and germicide power.

HYDROLEINE

(HYDRATED OIL)

FOR CONSUMPTION and WASTING DISEASES,

Produces Immediate Increase in Flesh and Weight.

FORMULA.

Each Dose of Two Teaspoonfuls equal to 120 Drops, contains:

Pure Cod Liver Oil...80 m. (drops)	Soda.....1.3 Grains.
Distilled Water.....35 "	Salicylic Acid.....1.4 "
Soluble Pancreatin.. 5 Grains.	Hyocholic Acid.....1.20 "

DOSE.—Two teaspoonfuls alone, or with twice the quantity of water to be taken thrice daily after meals.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhua, but a hydro-pancreated preparation containing acids and a modicum of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used completely saponifies the oleaginous material so necessary to the reparative process in all wasting diseases.

Each bottle in nutritive value exceeds ten times the same bulk of cod liver oil. It is economical in use and certain in results.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," by H. C. BARTLETT, Ph.D., F. C. S., *and the experiments which were made, together with cases illustrating the effect of Hydrated Oil in practice, are concisely stated in a Treatise on "Consumption and Wasting Diseases," by* G. OVEREND DREWRY, M.D. *Copies of these works sent free on application.*

SOLD AT ALL DRUG STORES, AT $1.00 PER BOTTLE.

C. N. CRITTENTON,

Sole Agent for the United States. 115 FULTON ST., NEW YORK.

A sample of Hydroleine will be sent free upon application, to any physician (inclosing business card) in the United States.

St. Louis College of Physicians and Surgeons.

The Ninth Academical year begins on September 1st and terminates on the last Saturday of May prox., comprising preliminary, regular and spring courses. The first and third optional. The regular session opens on the second Monday of October, continuing twenty weeks. The spring course offers all the opportunities of post-graduate instruction, inclusive of dissection, operations on cadaver, etc. Licensed practitioners by examination before Examining Boards or Boards of Health admitted to the graduating class. *Ad Eundem* degrees granted to graduates of two years standing by attending portion of regular course, and passing practical examination.

Fees for Academical Year, - - - - $50.00.
Matriculation, - - - - - 5.00, paid but once.
Graduation Examination, - - - - - 25.00, not returnable.

Abundant anatomical material at nominal prices for anatomical, pathological and operative pursuits. Abundant clinical material in all branches, inclusive. Practical obstetrics.

We submit it to the test of actual use, and a call at our office for purposes of examination is invited at any time.

WHEELER & EVANS, SOLE AGENTS,

No. 416 Walnut St., Philadelphia.

McARTHUR'S SYRUP.

(SYR: HYPOPHOS: COMP: C. P. McARTHUR.)

Its use is indicated in Consumption and Tuberculosis, Diseases of the Chest, Chronic Cough, Throat Affections, General Debility, Brain Exhaustion, Impotence and Loss of Memory.

The point of primary importance in the use of the Hypophosphites is their *chemical* purity, but unfortunately they are too often adulterated.

So little seems to be generally known, even among the medical profession, with regard to the chemistry of the Hypophosphites, and the absolute necessity of CHEMICAL purity, that we call attention to this point.

One of the first effects produced by the use of our CHEMICALLY PURE Hypophosphites is a general increase of nervous energy, with a feeling of ease and comfort.

The second effect is an increase of appetite; digestion is improved, and the bowels become regular in their action, the quantity and color of the blood is increased, respiration is controlled, a better expansion of the chest is observed, cough improves, easy expectoration is produced, night perspiration diminishes, the face becomes fuller, the lips red, the nails and hair grow, and in children the teeth, showing the importance of the Hypophosphites on the organ of nutrition.

☞ Physicians when prescribing will please write thus:

℞ SYR: HYPOPHOS: COMP: McARTHUR. ONE BOTTLE.

As it is made *only for physicians* there are no printed wrappers or advertisements about the bottle.

Our pamphlet on the **CURABILITY AND TREATMENT OF CONSUMPTION,** sent free to physicians upon application.

We will send one bottle of McArthur's Syrup to any physician, without charge, who will pay the express charges on the same.

Mention this Journal. McARTHUR HYPOPHOSPHITE CO., BOSTON, Mass.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of **considerably greater strength** and **efficacy** than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—Prof. SEEGEN.

"After twenty years' use I appreciate it as highly as ever."—Prof. VIRCHOW

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

SPECIFY (BATTLE) WHEN PRESCRIBING OUR PREPARATIONS.

BROMIDIA

THE HYPNOTIC.

FORMULA.—
Every Fluid drachm contains 15 grains EACH of pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH, of gen. imp. ext. Cannabis Ind. and Hyoscyam.

Dose.—One-half to one fluid-drachm in WATER or SYRUP every hour until sleep is produced.

Indications.—
Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers, it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, etc.

Indications.—
Same as Opium or Morphia.

Dose.—(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

THE ALTERATIVE & UTERINE TONIC.

FORMULA.—
Iodia is a combination of Active Principles obtained from the Green Roots of STILLINGIA, HELONIAS, SAXIFRAGA, Menispermum, and Aromatics. Each fluid drachm also contains five grains IOD. POTAS. and three grains PHOS. IRON.

Dose.—One or two fluid drachms (more or less, as indicated) three times a day, before meals.

Indications.—
Syphilitic, Scrofulous and Cutaneous Diseases. Dysmenorrhœa, Menorrhagia, Leucorrhœa, Amenorrhœa, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

JUST OUT!!

Third Edition, Revised, Enlarged, Illustrated.

ACCIDENTS AND EMERGENCIES.
BY CHARLES W. DULLES, M.D.

"This is the third edition, with revisions and enlargements, of an excellent manual, the practical qualities of which have been proven many times. It is a work that ought to be in every home, and every home that has a copy kept where it can be consulted at short notice is likely to find it worth many times its small cost."—*Philadelphia Evening Telegraph*, May 5, 1888.

"The illustrations are good and sufficiently numerous. The language is simple, being entirely devoid of technicalities, and the methods of treatment recommended are trustworthy and reliable. The manual is one of the best of this class of books, and should be in the library of every householder, ready for reference at a moment's notice."—*Science*, May 18, 1888.

Sent on Receipt of 75 Cents.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

MISS KENNEDY,

170 RIDGE AVENUE, ALLEGHENY, PA.

FOR SALE.—$2500 Practice in central New York. Purchaser only required to buy house and lot at about assessor's valuation. Pleasant town on railroad. Little competition. Reason, change of business. Terms easy.

Fels's Germicide Soap.

This certifies that I am familiar with the composition and method of manufacture of Fels's Germicide Soap, and that it is prepared with Naphthols, Eucalyptol, Methyl Salicylate, together with Mercuric Chloride, the last combined with the soap mass by a new process which preserves the antiseptic and germicide value.

Actual tests of this soap on culture fluids have shown a direct antiseptic and germicide power.

COLDEN'S LIQUID BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

An Invaluable Aid in the Treatment of all Cases of Debility.

☞ ESTABLISHED 15 YEARS. ☞ ENDORSED BY SCORES OF PHYSICIANS. ☞ BEWARE OF IMITATIONS.

☞ ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, Soluble Citrate of Iron, Cinchona, Gentian, and simple aromatics. An official analysis of this preparation by the eminent chemist, ARTHUR HILL HASSALL, M.D., F.R.S., and an endorsement of by Sir ERASMUS WILSON, F.R.S., is printed on the label of each bottle.

In the treatment of all cases of Debility, Convalescence from severe illness, Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Lack of Nerve Tone, and of the Alcohol and Opium Habits, and all maladies requiring a Tonic Nutrient, it is superior to all other preparations.

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion, and gives to weakened individuals that first prerequisite to improvement, an appetite.—By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label WITH IRON, "No. 1;" while the same preparation, WITHOUT IRON, is designated on the label as "No. 2."

☞ *I will, upon application, send a sample bottle of* COLDEN'S LIQUID BEEF TONIC *to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention* "COLDEN'S," *viz.,* "EXT. CARNIS FL. COMP. (COLDEN)." *It is put up in pint bottles, and* CAN BE HAD OF WHOLESALE AND RETAIL DRUGGISTS GENERALLY THROUGHOUT THE UNITED STATES.

C. N. CRITTENTON, Sole Agent, 115 Fulton Street, New York.

GLENN'S SULPHUR SOAP.

All physicians know the great value of the local use of Sulphur in the TREATMENT OF DISEASES OF THE SKIN. GLENN'S SULPHUR SOAP is the ORIGINAL and BEST combination of its kind, and the one now generally used. For sale by all Druggists at 25 cents a cake, or three cakes for 60 cents. Beware of counterfeits.

CONSTANTINE'S PINE TAR SOAP.

BY FAR THE BEST TAR SOAP MADE. Has been on trial among physicians for very many years as a toilet soap and healing agent, and its superior virtues have been unanimously conceded in ALL CASES WHERE THE USE OF TAR IS INDICATED.

Unsolicited expressions of its excellence have been received from the Medical Faculty generally. None genuine unless stamped "A. A. Constantine's Persian Healing Pine Tar Soap." For sale by all Druggists.

Wholesale Depot, C. N. CRITTENTON, 115 Fulton Street, New York.

Please mention THE SANITARIAN. ☞ Samples of above Soaps SENT FREE on application to any physician enclosing card.

St. Louis College of Physicians and Surgeons.

NESTLÉ'S FOOD

Is Especially Suitable for Infants in Hot Weather.

Requires no Milk in its Preparation, and is very Effective in the Prevention of Cholera-Infantum.

CONTENT!!

We employ no specialists to concoct puffs or analyses of Nestlé's Food. **We are content** during hot weather to quote the following unsolicited testimony to the value of Nestlé's Food given in Standard Works, viz.:

"Ziemssen's Cyclopedia of the Practice of Medicine." Vol. VII., says: **"IN CASES OF CHOLERA-INFANTUM NESTLE'S MILK FOOD IS ALONE TO BE RECOMMENDED."**

Prof. Sydney Ringer's 83d article in his Hand Book of Therapeutics, 11th Edition, says: **"I FIND NESTLE'S FOOD THE BEST OF ALL FOODS FOR CHILDREN OF GREAT DELICACY OF STOMACH AND INTESTINES."**

AN IMPORTANT ARTICLE BY C. F. H. ROUTH, M.D., M.R.C.P.L., THIRD EDITION—INFANT FEEDING.—Chap. 7, 183-4.

A kind of food which has acquired a great reputation is "Nestlé's Milk Food." Its composition shows a close resemblance to human milk in a *very assimilable form*. Its preparation is *easy*, for it only requires to be mixed with water and then to be boiled for a few minutes with continual stirring. A tablespoonful of the powder mixed with ten tablespoonfuls of water form a food to be given in a feeding bottle. A tablespoonful with five of water will produce a pap. If a child is predisposed to constipation, then it is to be given with more water; if subject to *diarrhœa* it should be given with less water and so used thicker.

Sample and pamphlet by Prof. Lebert sent on application to

THOS. LEEMING & CO., 18 College Place, New York.

Food in Cholera Infantum

and the

Summer Diarrhœa of Infants.

The food of an infant, ill with cholera infantum or summer diarrhœa, is a matter of the highest importance, and it is now well known that until milk in every form has been strictly excluded from the diet, no relief can be expected. Experience has proved that MELLIN'S FOOD, dissolved in water only, is the best diet in these diseases; given cold and in small amounts frequently repeated, the stomach will retain it without trouble. The great difficulty in the treatment of these complaints is thus immediately overcome, for the child will be nourished and its strength maintained. When convalescence has been established, milk, at first in small amount, can be added to the Mellin's Food, and gradually increased as the child is found to bear it.

A sample of MELLIN'S FOOD, *sufficient for trial, will be sent to any physician upon application.*

Doliber, Goodale & Co., Boston, Mass.

Friedrichshall.

THE WELL-KNOWN APERIENT MINERAL WATER.

IMPORTANT NOTICE.

By reason of an improved method of caption, by which dilution is avoided, FRIEDRICHSHALL WATER will be found now to be of considerably greater strength and efficacy than heretofore.

The ordinary dose is a large wineglassful (4 ounces), taken fasting. Most efficacious and more acceptable to the palate when heated or mixed with an equal quantity of very hot water.

"The most suitable aperient for prolonged use."—Prof. SEEGEN.

"After twenty years' use I appreciate it as highly as ever."—Prof. VIRCHOW

OF ALL DRUGGISTS AND MINERAL WATER DEALERS.

YOU WILL FIND **BROMO-CAFFEINE** OF GREATEST SERVICE IN OF ALL TYPES **NERVOUS HEADACHES** OF ALL TYPES

Headaches from Loss of Sleep, Physical Fatigue, Excessive Study, Mental Anxiety, Neurasthenia, Dysmenorrhœa, Pregnancy, or other Ovarian Irritation. Relieves Insomnia, and is very useful in Asthma, Whooping Cough and Nervous Cough. Prevents Tinnitis Aurium during the administration of Quinine. Cures Sea Sickness, Quiets the Restlessness of Alcoholism, Morphia Craving, &c. Relieves Anxiety and Promotes Sleep.

HYDRONAPHTHOL

ANTISEPTIC, DISINFECTANT, GERMICIDE & PRESERVATIVE.

This valuable derivative of Coal Tar is no longer an experiment, but has fairly won a permanent place high up in the list of modern **Antiseptics.** After severest tests and experiments in both Hospital and Private Practice it has been accorded a place second only to Mercuric Bicloride in point of Germicidal power and being non-poisonous and non-corrosive it is preferable to that well-known agent for all the purposes for which it is recommended. **HYDRONAPHTHOL** is free from the odor and escharotic properties of Carbolic Acid and other phenols, hence it is a pleasant and valuable **Internal Antiseptic.** Therefore, aside from its value as a general **Antiseptic, Disinfectant, Germicide** and **Preservative** it is being used with great satisfaction as an internal remedy in Cancer of the Stomach, Chronic Dyspepsia, Gastritis, Typhoid Fever and other diseases of the Alimentary canal; also in Eneuresis, Cystitis, Rheumatism and Gout. As a local application Dr. C. W. Allen, of N. Y., and other Dermatologists of note have found **HYDRONAPHTHOL** superior to all other remedies in the treatment of Ulcers, Eczema, Scabies, Impetigo, Pruritus, Pityriasis Capitis, Alopecia, Favus and other skin diseases. It also preserves Anatomical and Pathological specimens in their natural condition preventing shrinkage or decay. **HYDRONAPHTHOL** is freely soluble in hot water alcohol, benzine and the fixed oils. We supply it in crude form or incorporated in our absorbent cotton gauze, jute, lint or any dressing that can be rendered absorbent. We also prepare a rubber dermatological plaster containing 20 per cent. **HYDRONAPHTHOL,** as well as a toilet and a medicinal soap containing one per cent. and five per cent. respectively of the drug. A book fully descriptive of **HYDRONAPHTHOL** mailed free to Physicians.

MALTINE.

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms, is the only Malt Preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides and the Iodides.

It deserves to stand in the front rank of constructives; and the constructives by their preventive, corrective, and curative power, are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may often be resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan and Dimmock, *only three* possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract and Keppler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. R. H. CRITTENDEN, *Professor of Physiological Chemistry in Yale College.*

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe; and recent analysis made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—superior to all other Malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	**MALTINE** with Peptones.	**MALTINE** Ferrated.
MALTINE with Alteratives.	**MALTINE** with Pepsin & Pancreatine	**MALTO-YERBINE.**
MALTINE with Cod Liver Oil.	**MALTINE** with Phosphates, Iron Quinine and Strychnia.	**MALTO-VIBURNIN.**
MALTINE with Hypophosphites.		**MALTINE** with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "MALTINE" should be written, and not simply the words "Malt Extract" or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply the regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

The Maltine Manufacturing Co.,

Laboratory, Yonkers-on-Hudson. **182 Fulton Street, New York.**

COMPLIMENTARY SAMPLES.

For purifying the atmosphere of the sick-room, for deodorizing and disinfecting the discharges from the sick, for combating contagion, as an antiseptic in the lying-in-chamber, and as a general disinfectant for all household purposes, PLATT'S CHLORIDES is now recognized as the standard preparation; and through the kindly interest of the Medical profession, coupled with its proven merit, has become established in large demand.

During the past seven years we have personally presented the physicians of the larger cities of the United States samples for test and use, and the result has been so eminently satisfactory, and our solution has become of such sanitary assistance to the doctor, such an aid to the recovery of the patient, and so great a blessing to the attendants, we earnestly desire now to make it known to all who are still unacquainted with it, including particularly the physicians in the smaller cities, towns, and villages, and all points that we can reach by express.

To this end we will, during the next three months, forward by express, *prepaying all charges ourselves*, a full pint bottle of our PLATT'S CHLORIDES to each physician favoring us with name, P. O. address, and express office.

We feel and believe that an odorless and efficient disinfectant is of as great value and usefulness to the doctor of the small place as of the large city, and we trust that the hundreds of worthy practitioners whom we have not hitherto reached we may now hear from.

Yours truly, HENRY B. PLATT, 36 Platt St., New York.

N. B.—PLATT'S CHLORIDES is an odorless liquid.
Is indorsed by over 16,000 physicians.
Is used by diluting with from two to twenty parts of water, as may be indicated.
Sprinkled about leaves no stain or smell.
Is sold by druggists in quart bottles only. Price, 50 cents.
Send for sample, and in doing so mention THE MEDICAL AND SURGICAL REPORTER.

FELLOWS'

HYPO-PHOS-PHITES

(SYR: HYPOPHOS: COMP: FELLOWS)

Contains **The essential elements** to the Animal Organization—Potash and Lime.

The **Oxydizing Agents**—Iron and Manganese;

The **Tonics**—Quinine and Strychnine;

And the **Vitalizing Constituent**—Phosphorus,

Combined in the form of a Syrup, with *slight alkaline reaction.*

It Differs in Effect from all others, being pleasant to taste, acceptable to the stomach, and harmless under prolonged use.

It has Sustained a High Reputation in America and England for efficiency in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs, and is employed also in various nervous and debilitating diseases with success.

Its Curative Properties are largely attributable to Stimulant, Tonic, and Nutritive qualities, whereby the various organic functions are recruited.

In Cases where innervating constitutional treatment is applied, and tonic treatment is desirable, this preparation will be found to act with safety and satisfaction.

Its Action is Prompt; stimulating the appetite and the digestion, it promotes assimilation, and enters directly into the circulation with the food products.

The Prescribed Dose produces a feeling of buoyancy, removing depression or melancholy, and hence is of great value in the treatment of MENTAL AND NERVOUS AFFECTIONS.

From its exerting a double tonic effect and influencing a healthy flow of the secretions, its use is indicated in a wide range of diseases.

TERRACE BANK HOSPITAL FOR WOMEN.

(DR. SUTTON'S PRIVATE SANITORIUM.)

This institution, remodeled and enlarged, is now open for reception of patients.

It is located on a fashionable avenue in Allegheny City, directly opposite to and in full view of the city of Pittsburg, Pa. The rooms are large and well ventilated, by means of open grates, with natural gas for fuel. None excepting trained nurses are employed. They are under the direct supervision of a competent resident physician. The culinary department is excellent, and the dining-room is managed on the restaurant plan of small tables and excellent servants. The rooms vary in price from $15 to $35 per week, including the services of nurses and servants, light and heat. In all cases the professional fees are $15 per week.

Surgical operations are not included in the above. Drugs and liquors are furnished at cost, and all laundry work of patients is sent, at their own expense, to the laundries of the city. Dr. Sutton spends the half of every day, viz., from 1 P. M. to 6 P. M., at the institution. For further information address the matron,

CARNRICK'S SOLUBLE FOOD

IS UNLIKE ANY OTHER INFANTS' FOOD THAT HAS EVER BEEN PRODUCED.

THE FORMULA.

℞

Partially Predigested Milk Solids,	**45 parts.**
Wheat, with the Starch converted into Dextrin,	**45 "**
Milk Sugar,	**10 "**

We do not claim this food to be a "perfect substitute for human milk." But we do claim that Carnrick's Food approaches nearer to human milk in constituents and digestibility than any other food that has ever been produced, and that it is the only infants' food that will, without the addition of cow's milk, thoroughly nourish a child from its birth.

We believe that Carnrick's Food solves the problem of a reliable substitute for human milk. The Casein of cows' milk, by partial predigestion with freshly made Pancreatine, is rendered as easily digestible by the infant as human milk.

We have never published an analysis of Carnrick's Food "prepared with milk," for, unlike all other foods, it is prepared by the addition of water only, and we base our claims upon the intrinsic value of the food as compared with an equal amount of the solid constituents of human milk. All other analyses or comparisons are misleading. We challenge similar comparisons with any other food and confidently believe, that if Carnrick's Food is depended upon for the nutrition of infants, the great mortality among children will be reduced.

Full information regarding the process of manufacture will be cheerfully furnished and samples sent free to those who wish to test Carnrick's Food.

REED & CARNRICK,

——NEW YORK.——

McARTHUR'S SYRUP.

(SYR: HYPOPHOS: COMP: C. P. McARTHUR.)

Its use is indicated in Consumption and Tuberculosis, Diseases of the Chest, Chronic Cough, Throat Affections, General Debility, Brain Exhaustion, Impotence and Loss of Memory.

The point of primary importance in the use of the Hypophosphites is their *chemical* purity, but unfortunately they are too often adulterated.

So little seems to be generally known, even among the medical profession, with regard to the chemistry of the Hypophosphites, and the absolute necessity of CHEMICAL purity, that we call attention to this point.

One of the first effects produced by the use of our CHEMICALLY PURE Hypophosphites is a general increase of nervous energy, with a feeling of ease and comfort.

The second effect is an increase of appetite; digestion is improved, and the bowels become regular in their action, the quantity and color of the blood is increased, respiration is controlled, a better expansion of the chest is observed, cough improves, easy expectoration is produced, night perspiration diminishes, the face becomes fuller, the lips red, the nails and hair grow, and in children the teeth, showing the importance of the Hypophosphites on the organ of nutrition.

☞ Physicians when prescribing will please write thus:

℞ SYR: HYPOPHOS: COMP: McARTHUR. ONE BOTTLE.

As it is made *only for physicians* there are no printed wrappers or advertisements about the bottle.

Our pamphlet on the **CURABILITY AND TREATMENT OF CONSUMPTION,** sent free to physicians upon application.

We will send one bottle of McArthur's Syrup to any physician, without charge, who will pay the express charges on the same.

Mention this Journal. McARTHUR HYPOPHOSPHITE CO., BOSTON, Mass.

Fels's Germicide Soap.

This certifies that I am familiar with the composition and method of manufacture of Fels's Germicide Soap, and that it is prepared with Naphthols, Eucalyptol, Methyl Salicylate, together with Mercuric Chloride, the last combined with the soap mass by a new process which preserves the antiseptic and germicide value.

Actual tests of this soap on culture fluids have shown a direct antiseptic and germicide power.

C. L. BOWER, M.D.

Clinical and practical instruction in the medical and surgical specialties is afforded, to physicians only, during the entire year. The College has well-fitted laboratories of pathology, microscopy, anatomy, surgery and electro-therapeutics.

In addition to the clinical facilities of the dispensary the professors utilize, for purposes of instruction, their services in the Philadelphia, Pennsylvania, Wills, Howard, Episcopal, Presbyterian, German, St. Mary's, and St. Christopher's Hospitals.

The Fee for each branch, for six consecutive weeks from date of issue, is $15.00. Any number of branches may be taken.

L. W. STEINBACH, M. D. *Secretary*,
At the College Building, N. W. Cor. Broad and Lombard Sts., Phila.

COMPLIMENTARY SAMPLES.

For purifying the atmosphere of the sick-room, for deodorizing and disinfecting the discharges from the sick, for combating contagion, as an antiseptic in the lying-in-chamber, and as a general disinfectant for all household purposes, PLATT'S CHLORIDES is now recognized as the standard preparation; and through the kindly interest of the Medical profession, coupled with its proven merit, has become established in large demand.

During the past seven years we have personally presented the physicians of the larger cities of the United States samples for test and use, and the result has been so eminently satisfactory, and our solution has become of such sanitary assistance to the doctor, such an aid to the recovery of the patient, and so great a blessing to the attendants, we earnestly desire now to make it known to all who are still unacquainted with it, including particularly the physicians in the smaller cities, towns, and villages, and all points that we can reach by express.

To this end we will, during the next three months, forward by express, *prepaying all charges ourselves*, a full pint bottle of our PLATT'S CHLORIDES to each physician favoring us with name, P. O. address, and express office.

We feel and believe that an odorless and efficient disinfectant is of as great value and usefulness to the doctor of the small place as of the large city, and we trust that the hundreds of worthy practitioners whom we have not hitherto reached we may now hear from.

Yours truly, HENRY B. PLATT, 36 Platt St., New York.

N. B.—PLATT'S CHLORIDES is an odorless liquid.
Is indorsed by over 16,000 physicians.
Is used by diluting with from two to twenty parts of water, as may be indicated.
Sprinkled about leaves no stain or smell.
Is sold by druggists in quart bottles only. Price, 50 cents.
Send for sample, and in doing so mention THE MEDICAL AND SURGICAL REPORTER.

The Medical and Surgical Reporter,

ONE OF THE OLDEST MEDICAL JOURNALS IN AMERICA.

It aims to meet the average wants of the medical man, being always interesting, instructive and clear, filled with *practical articles*, such as may be useful to the practitioner, rather than the laboratory student. It contains valuable original articles, full reports of clinics, hospital notes, society proceedings, reviews of new books and of medical pamphlets, literary notes, interesting correspondence,

Abstracts from the Best Medical Journals all over the World,

Bright Items of News, and some HUMOR in every number. The EDITORIALS are prepared with especial regard to the good of its readers and the interest of the profession.

THE REPORTER is *not published in the interest of any medical school or publishing house*, but

FOR ITS READERS.

We hope that it may be—in the future even more than in the past—an honored means of communication between the best men in the medical profession.

OFFER FOR NEW SUBSCRIBERS:

To any new subscriber we will send the REPORTER from this date to the end of the year, for $3.00, paid in advance.

Address,

Drs. RANDOLPH & DULLES,

P. O. Box, 843. PHILADELPHIA.
